COM-208: Computer Networks - Quiz 4 (A)

Name: SCIPER:

- 1. Given a network topology and link costs, will Dijstra's algorithm or Bellman-Ford produce paths with lower costs?
 - (a) Dijkstra's.
 - (b) Bellman-Ford.
 - (c) They will produce the same paths. (Correct)
- 2. In a link-state routing algorithm (like Dijkstra), each router computes:
 - (a) a path from itself to every other router. (Correct)
 - (b) a path between every pair of routers in the network.
 - (c) a path between every pair of end-systems in the network.
- 3. In a distance vector algorithm (like Bellman-Ford), each router periodically exchanges routing information with:
 - (a) no other router.
 - (b) all of its neighbour routers. (Correct)
 - (c) all the routers in the network.
- 4. Routers R_1 , R_2 , and R_3 are connected in a triangle. R_1 routes to R_3 through R_2 . A poisoned reverse ensures that:
 - (a) R_1 never routes to R_3 through R_2 .
 - (b) R_3 never routes to R_1 through R_2 .
 - (c) R_2 never routes to R_3 through R_1 . (Correct)
- 5. Every router on the Internet must speak at least:
 - (a) one routing protocol.
 - (b) one link-state routing protocol and one distance-vector routing protocol.
 - (c) one intra-domain routing protocol and one inter-domain routing protocol. (Correct)
- 6. Alice wants to send a confidential message m to Bob. Which of the following should she send?
 - (a) $K_B^+\{m\}$ (*m* encypted with Bob's public key). (Correct)
 - (b) $K_A^+\{m\}$ (m encypted with her public key).
 - (c) $K_A^-\{m\}$ (m encypted with her private key).
- 7. Alice wants to send a message m to Bob and prove that the message is from her. Appending which of the following to m would achieve this goal?
 - (a) $K_B^+\{m\}$ (*m* encypted with Bob's public key).
 - (b) $K_A^+\{m\}$ (m encypted with her public key).
 - (c) $K_A^-\{m\}$ (m encypted with her private key). (Correct)
- 8. We add nonces to message authentication codes (MACs) in order to:
 - (a) prevent replay attacks. (Correct)
 - (b) prevent man-in-the-middle attacks.
 - (c) make it harder for an attacker to break the MAC.
- 9. We use certificates in order to:
 - (a) prevent replay attacks.
 - (b) prevent man-in-the-middle attacks. (Correct)
 - (c) speed up encryption and decryption.
- 10. Alice wants to use <u>a</u>symmetric key cryptography to send confidential messages to many receivers. The <u>minimum</u> amount of information she need to have before she starts communicating with the receivers is:
 - (a) a shared secret key with each receiver.
 - (b) each receiver's public key.
 - (c) the public key of a trusted certificate authority. (Correct)
