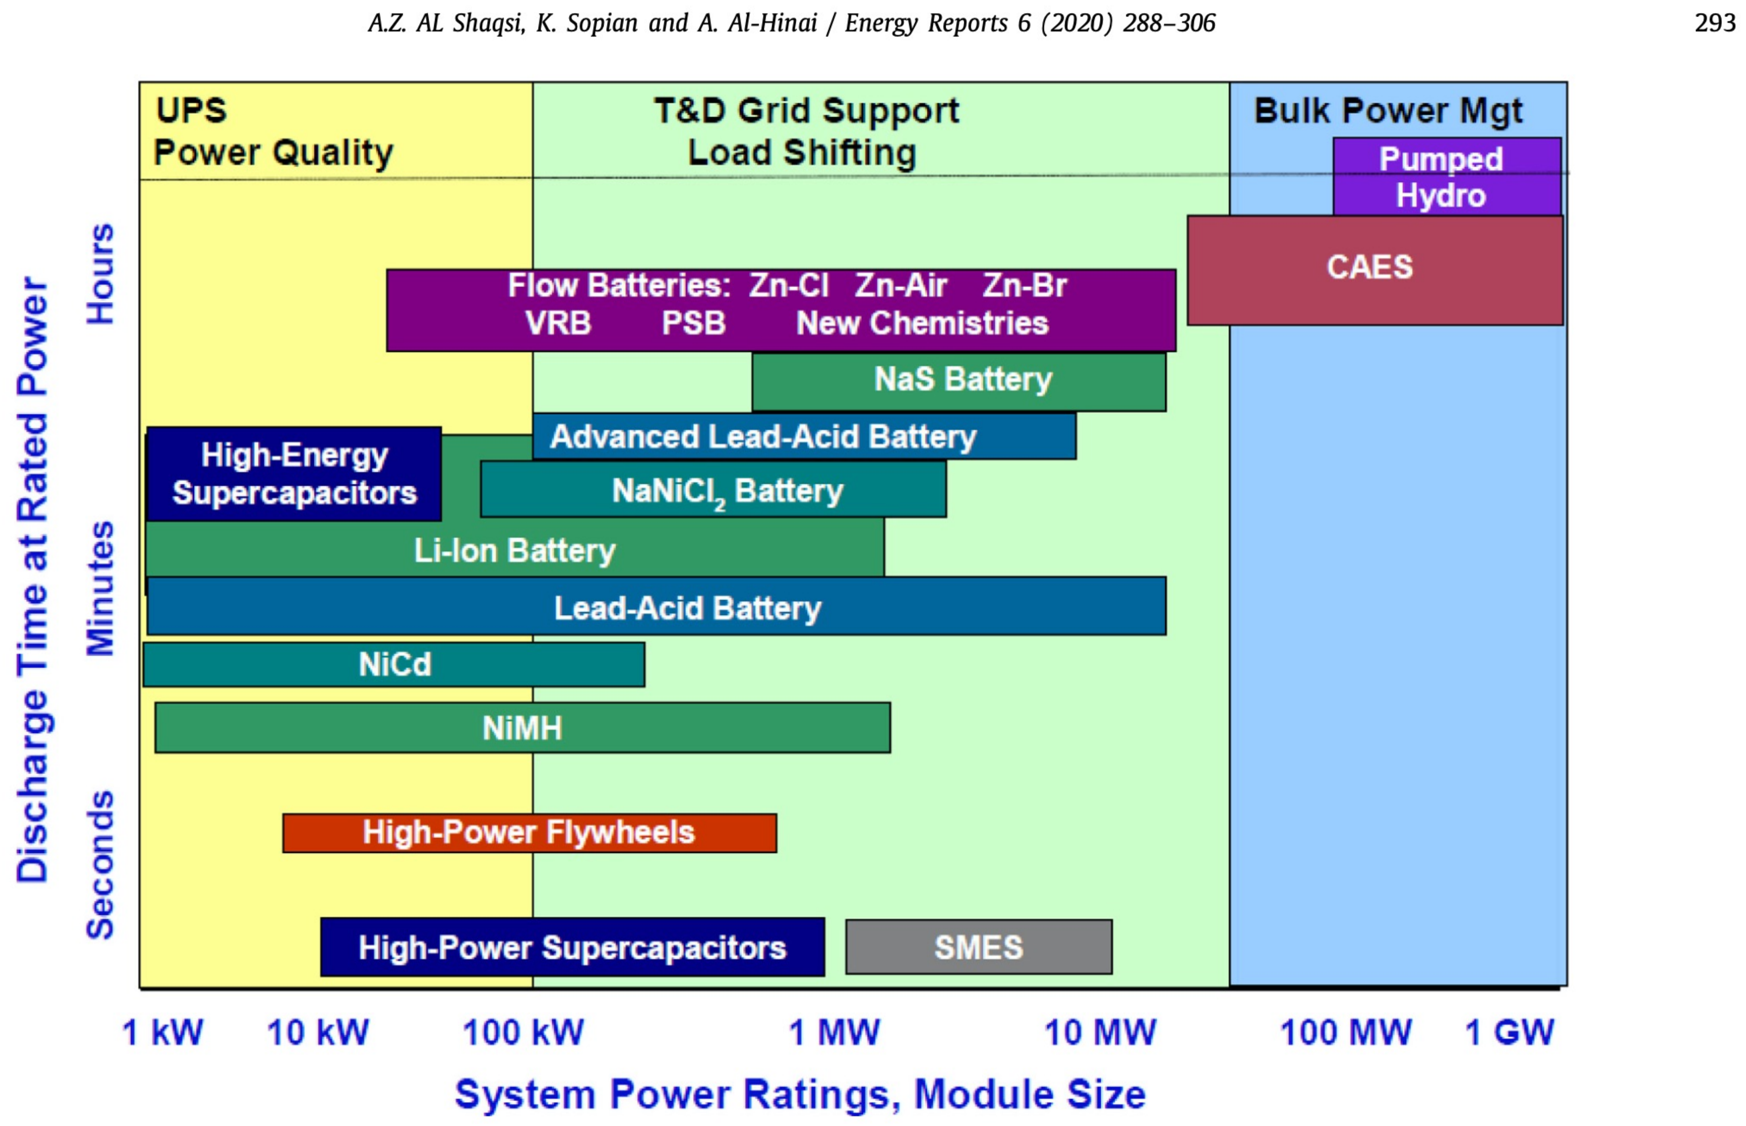
Storage and Power-to-Gas

Learning objectives

- Electricity storage state-of-the-art
- Overview of H_2 uses, actual and potential
- Thermodynamics and efficiency of electrolysis
  – various technologies (water (H^+ / OH^-), steam)
  – heat integration
- Storage of H_2

Current situation in electricity storage

Possible technologies for electricity storage



Existing storage capacity

2018: 173 GWe, of which
98% pumped hydro schemes

Energy Storage Technology and Cost Characterization Report, July 2019

https://www.energy.gov/eere/water/hydrowires-initiative

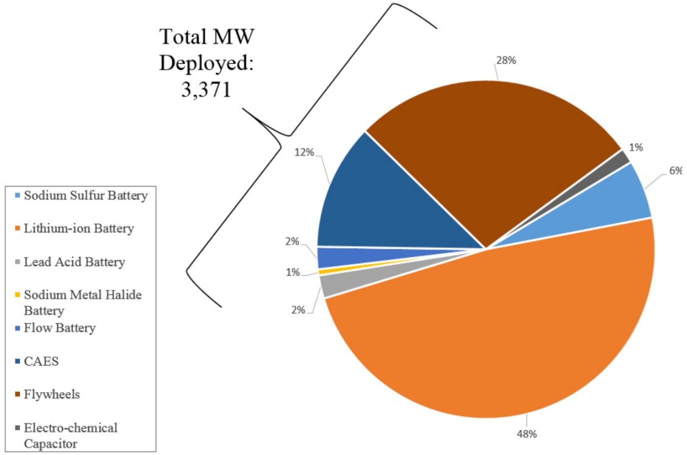
2.0 Worldwide Energy Storage Deployments by Technology

As of 2018, nearly 173 GW of energy storage had been deployed across the world. Table 2.1 outlines the current total installed capacity in megawatts by technology type worldwide up to 2018. Information was gathered from the DOE Storage Database (DOE 2018a) and compiled by technology type. Note that some of the records from the database are unverified and therefore the numbers below should be considered approximate.

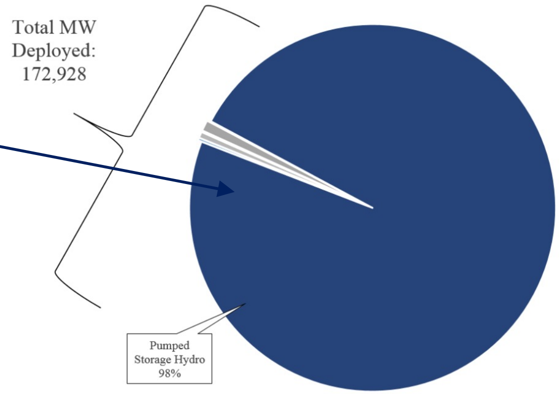
Table 2.1. Worldwide deployment by technology type, 2018.

Technology	MW Deployed
Sodium sulfur	189
Lithium-ion	1,629
Lead acid	75
Sodium metal halide	19
Flow battery	72
PSH	169,557
CAES	407
Flywheels	931
Electrochemical capacitor	49
Total	172,928

Li-ion dominate batteries schemes



Breakdown of energy storage deployed internationally by technology type and excluding pumped storage hydro.



Proportion of megawatts of internationally deployed pumped storage hydro in comparison to other technologies.

Fast growth in storage capacity (esp. Li-ion)

Cost metric: LCOS (levelized cost of storage)

$$LCOS\left[\frac{\$}{MWh}\right] = \frac{\overbrace{\text{Investment cost}}^{\text{dominant cost}} + \sum_n^N \frac{O\&M\ cost}{(1+r)^n} + \sum_n^N \frac{\overbrace{\text{Charging cost}}^{2^{nd}\ \text{largest}}}{(1+r)^n} + \frac{End\text{-}of\text{-}life\ cost}{(1+r)^{N+1}}}{\sum_n^N \frac{Elec_{Discharged}}{(1+r)^n}}.$$

- = total lifetime cost of the investment in an electricity storage technology, divided by its cumulative delivered electricity
- this metric accounts for all technical and economic parameters affecting the **lifetime cost of discharging stored electricity**.
- directly comparable to the levelized cost of electricity (LCOE) for electricity generation technologies.
- key parameters that affect the LCOS of each technology, set by the respective applications, are: nominal power capacity (kW), discharge duration (h), annual cycles (number), and electricity price (€/kWhe)

Schmidt et al., Joule 3, 81–100
January 16, 2019 a 2018 Elsevier Inc.
https://doi.org/10.1016/j.joule.2018.12.008

Results of LCOS study

Schmidt et al., Joule 3, 81–100
January 16, 2019 a 2018 Elsevier Inc.
https://doi.org/10.1016/j.joule.2018.12.008

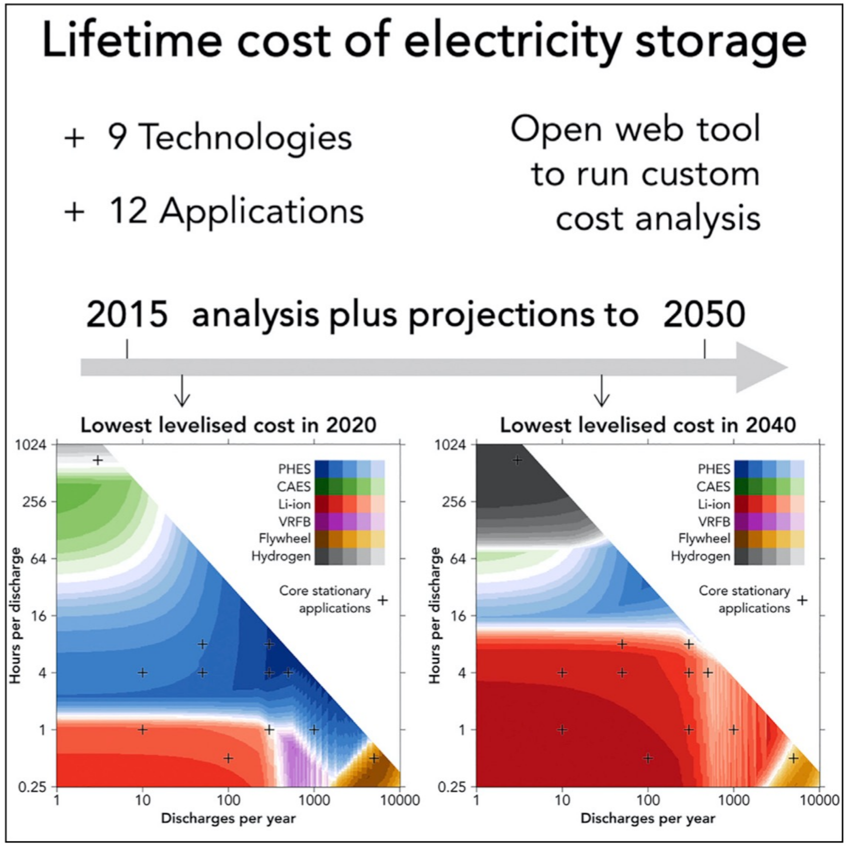
PHS / CAES: ‘slow’ response time (>10 s) and large minimum sizes (>5 MWe) => not suited for primary elec.grid response and power quality and small-scale consumption.

Flywheels and supercapacitors : short discharge (<1 h) => not suited for longer-term power.

Seasonal storage (months, >700h): only met by technologies where energy storage capacity is fully independent of power capacity. **(PtG, H_2)**

Article

Projecting the Future Levelized Cost of Electricity Storage Technologies



Oliver Schmidt, Sylvain Melchior, Adam Hawkes, Iain Staffell

o.schmidt15@imperial.ac.uk

HIGHLIGHTS

Lifetime cost for 9 storage technologies in 12 applications from 2015 to 2050

Lowest lifetime costs fall by 36% (2030) and 53% (2050) across the 12 applications

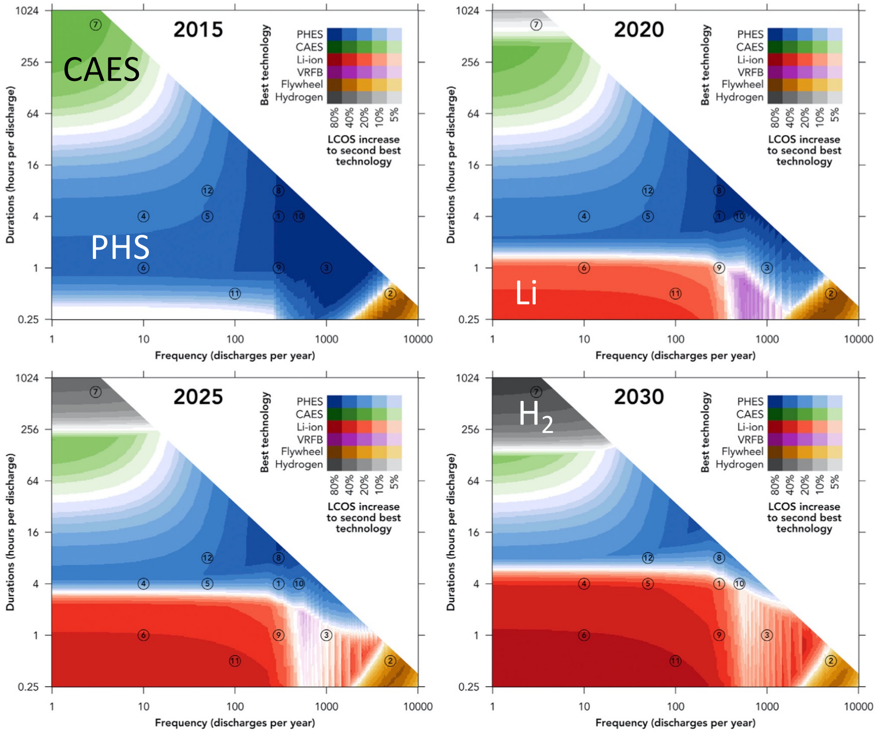
Lithium-ion batteries are most competitive in majority of applications from 2030

Pumped hydro, compressed air, and hydrogen are best for long discharge applications

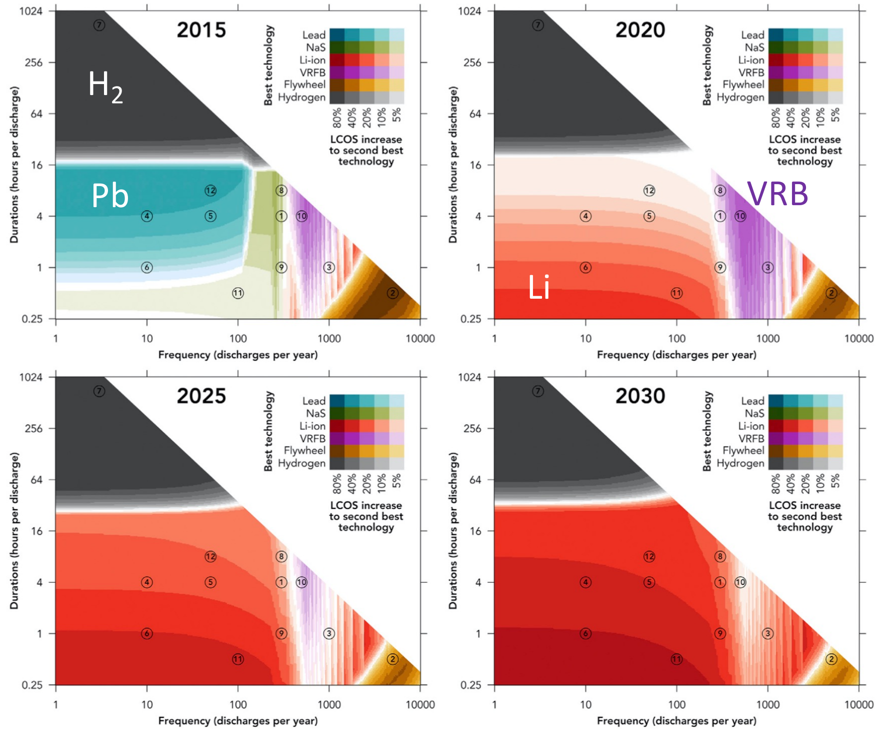
Schmidt et al., Joule 3, 81–100
January 16, 2019 a 2018 Elsevier Inc.
https://doi.org/10.1016/j.joule.2018.12.008

Excluding PHS & CAES, H_2 could be more cost-effective than batteries for discharges > 1 day

All technologies



Technologies excluding PHS / CAES



Summary on electricity storage

- By far the most used today : pumped hydro storage (**PHS**)
  - 93% of world total (173 GWe)
  - minimal size of **5 MWe**

- Smaller scale and short term : **batteries**
  - 5% of world total (9 GWe), dominated by Li-ion (90%)
  - maximal discharge time = **1 day**
  - adapted for residential PV (**1-20 kWe**)

- Middle segment between PHS and batteries can be captured by **P2G**
  - from few **10 kWe to few MWe**
  - energy size and power size are uncoupled => long term storage
  - for storage > 1 day, P2G could become economical

Hydrogen H_2 (=stored electricity) in energy and industry uses: present and future

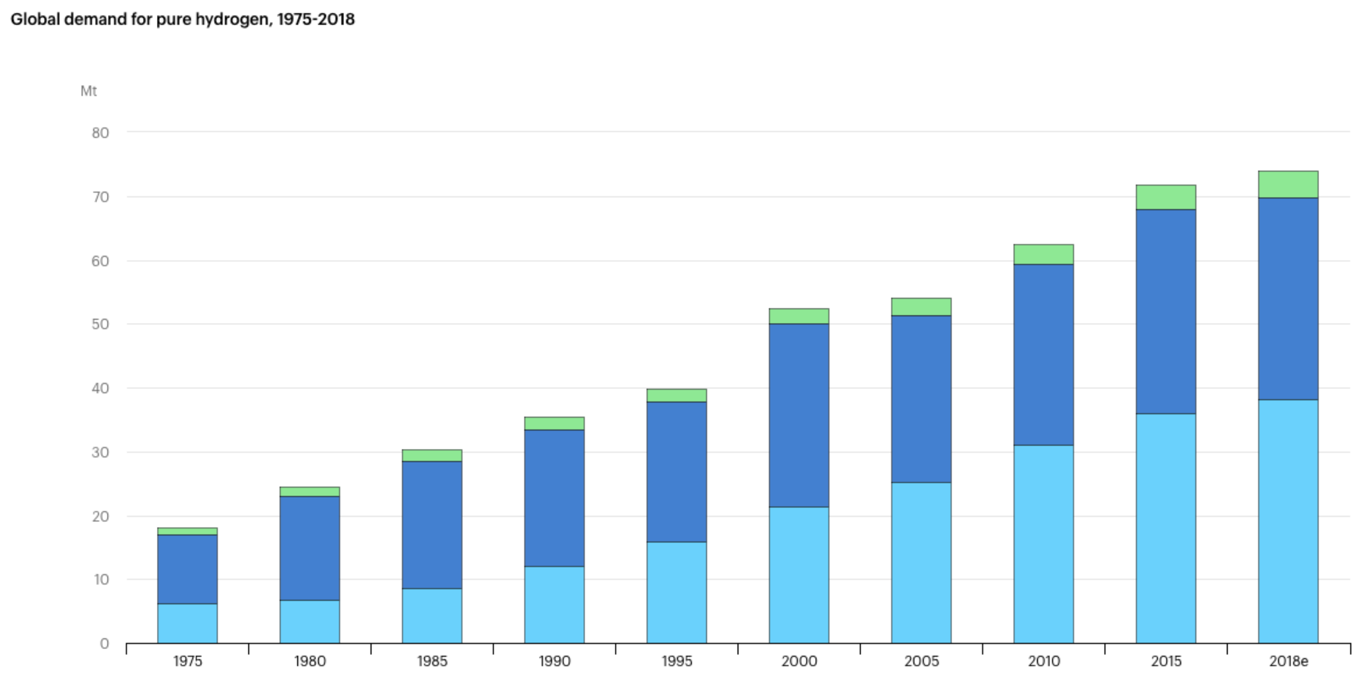
Grey, blue, green H_2

- **Grey H_2** : made from fossil sources
- **Blue H_2** : made from fossil sources but including carbon capture
- **Green H_2** : made from renewable sources

Annual H_2 production

- ≈75 Mt/yr ≈ 830 10^9 m^3 /yr ≈ 10 EJ (2800 TWh) = 2% of world energy
  - 49% from natural gas
  - 29% from oil
  - 18% from coal
  - 4% from electrolysis

96% from fossil sources



- By comparison: natural gas 4000 10^9 m^3 /yr = 140 EJ (24% of world energy – 580 EJ)

Electrolytic H_2 : e.g. chlor-alkali-industry

- Production 2017: 58 Mton Cl_2 (650 plants)
- Elec. consumption: 2.1 – 3.4 kWhe / kg Cl_2
- (assume avg of 2.5 kWhe / kg Cl_2) => 150 TWhe

  ≈ **25-30 GWe** worldwide
- ≈0.6% of world electricity (25 PWh)
- this co-produces 1.6 Mt H_2 = 54 TWh H_2, accounting for >½ of all electrolytic H_2

Chlor-alkali process (1888)

$2NaCl + 2H_2O \Rightarrow 2NaOH + Cl_2 + H_2$

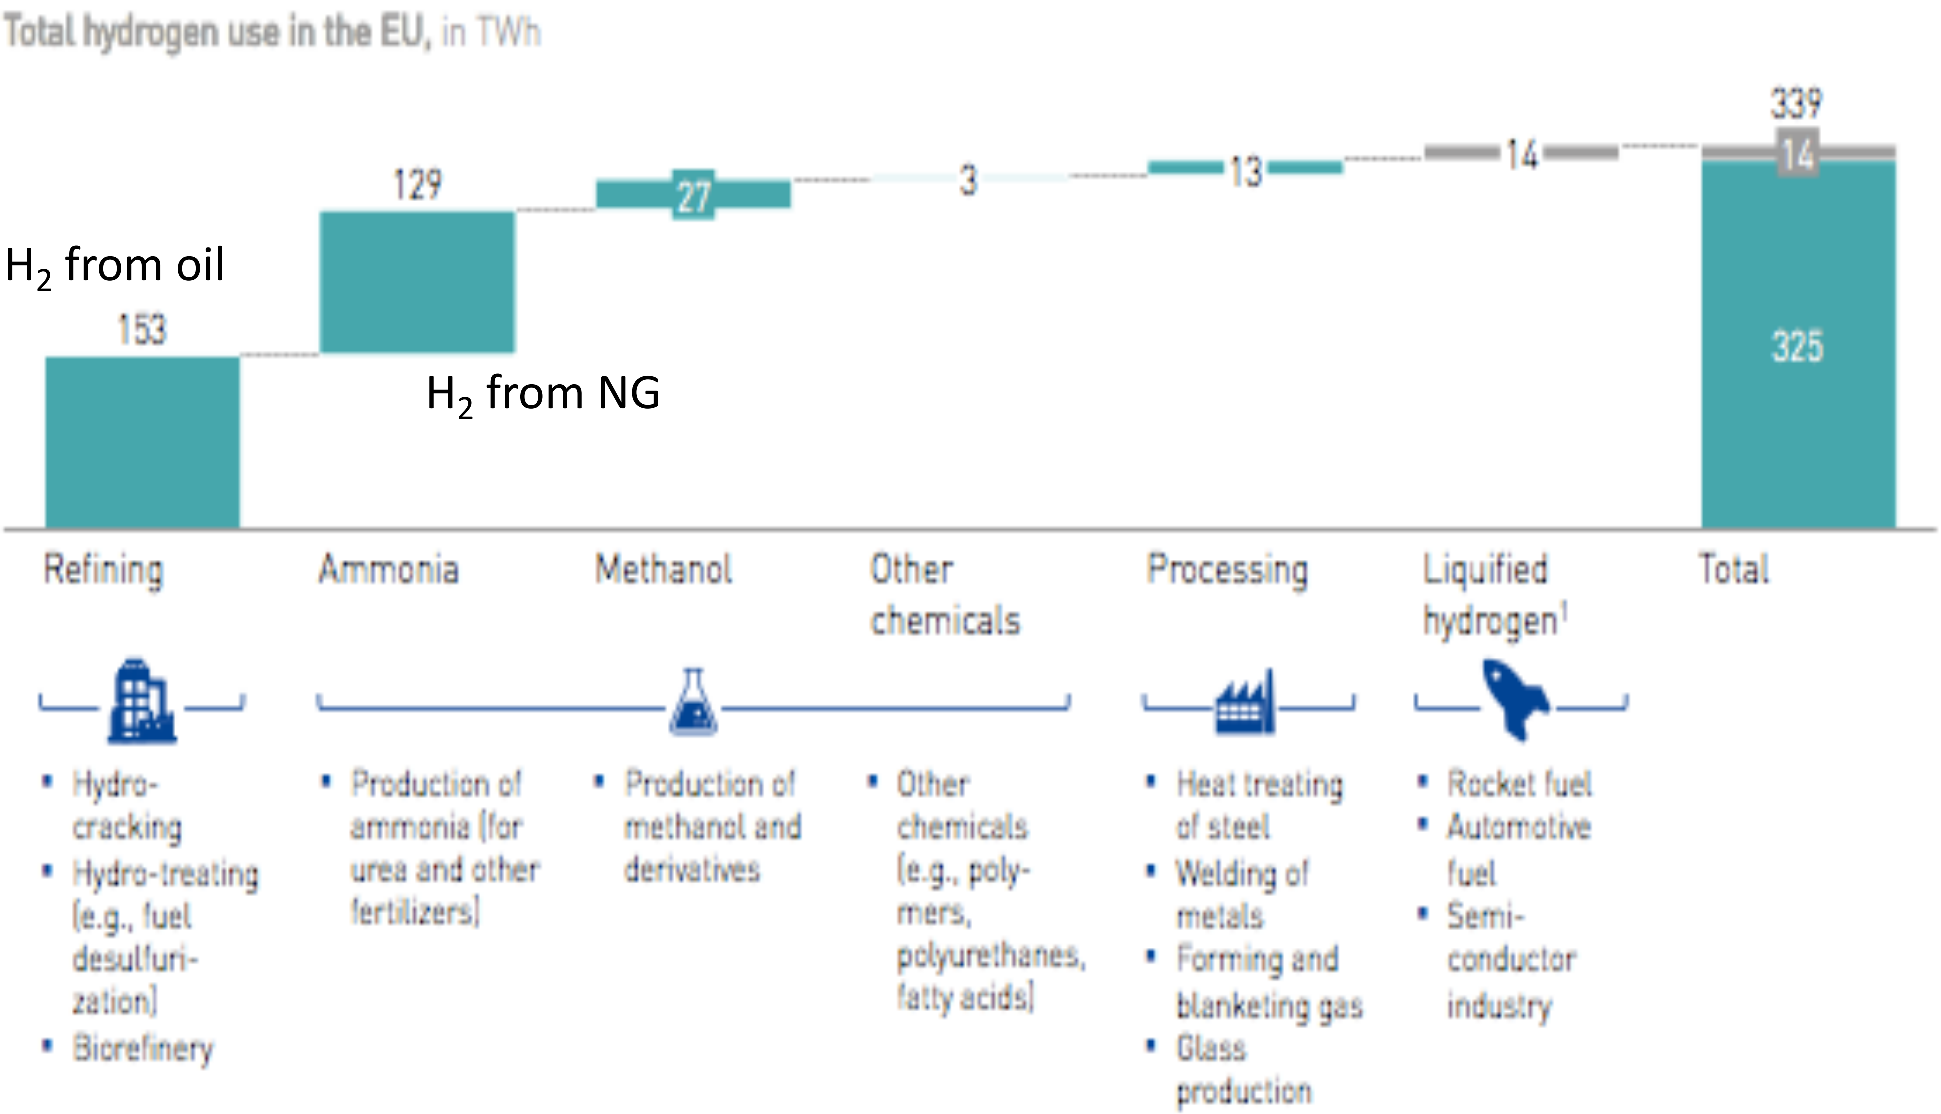
Current uses of H_2 (EU)



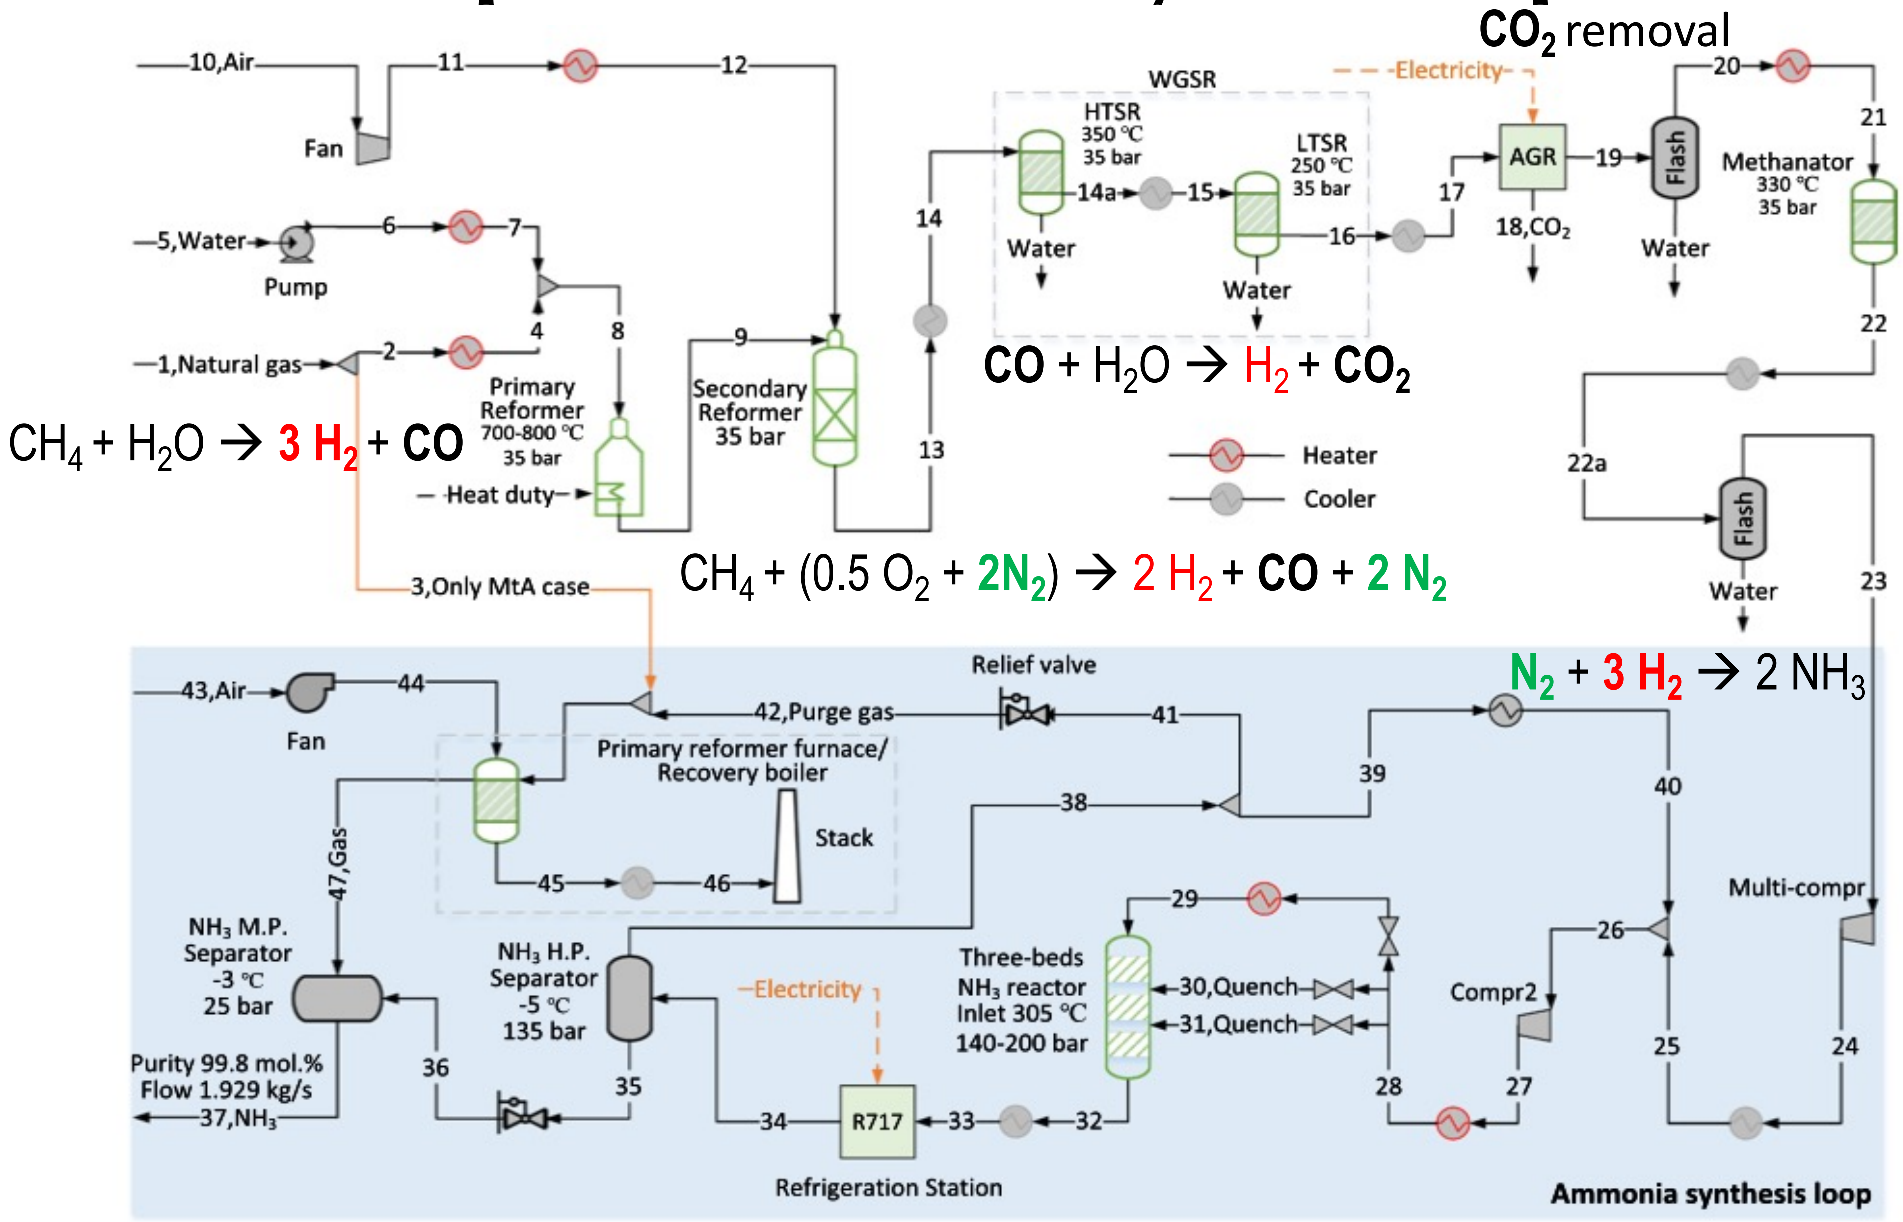
FUEL CELLS AND HYDROGEN JOINT UNDERTAKING

fch.europa.eu
H2 Raodmap for Europe, January 2019
Exhibit 17 p.40

H_2 current uses

- Refineries (47%): hydrodesulphurisation (HDS), hydro-cracking to multiple useful oil fractions
- Ammonia (NH_3) production (fertiliser) (40%)
- Methanol (8%) and other chemicals (1%)
- 'Light' industries (4%): where reducing atmosphere is needed
  - metal treatment
  - semiconductor industry
  - glass making (glass floating on liquid tin baths)
  - food (fats hydrogenation)
- 325 TWh or 1.2 EJ (2% of final EU energy)

Example: ammonia synthesis plant



$$CH_4 + H_2O \rightarrow 3\ H_2 + CO$$

$$CO + H_2O \rightarrow H_2 + CO_2$$

$$CH_4 + (0.5\ O_2 + 2N_2) \rightarrow 2\ H_2 + CO + 2\ N_2$$

$$N_2 + 3\ H_2 \rightarrow 2\ NH_3$$

Techno-economic comparison of green ammonia production processes, Fig. 1
H Zhang, L Wang, J Van herle, F Maréchal, U Desideri, *Applied Energy* **259, 114135 (2020)**

Planned future H_2 uses

- Mobility : fuel cell vehicles
- Residential heating : natural gas network admixing, and/or H_2 pipelines
- Industry:
  - industry heating: replacing coal, natural gas
  - industry feedstock:
    - refineries
    - ammonia, methanol, other industries
    - steel making
  - light industries

Example: oil refinery

https://refhyne.eu/

Rheinland refinery (Shell) (D)

Consumption: **180’000 t H_2** / yr (from fossils)

10 MWe PEM-electrolyser:
=> supplies **1300 t H_2** / yr (<1% !!)

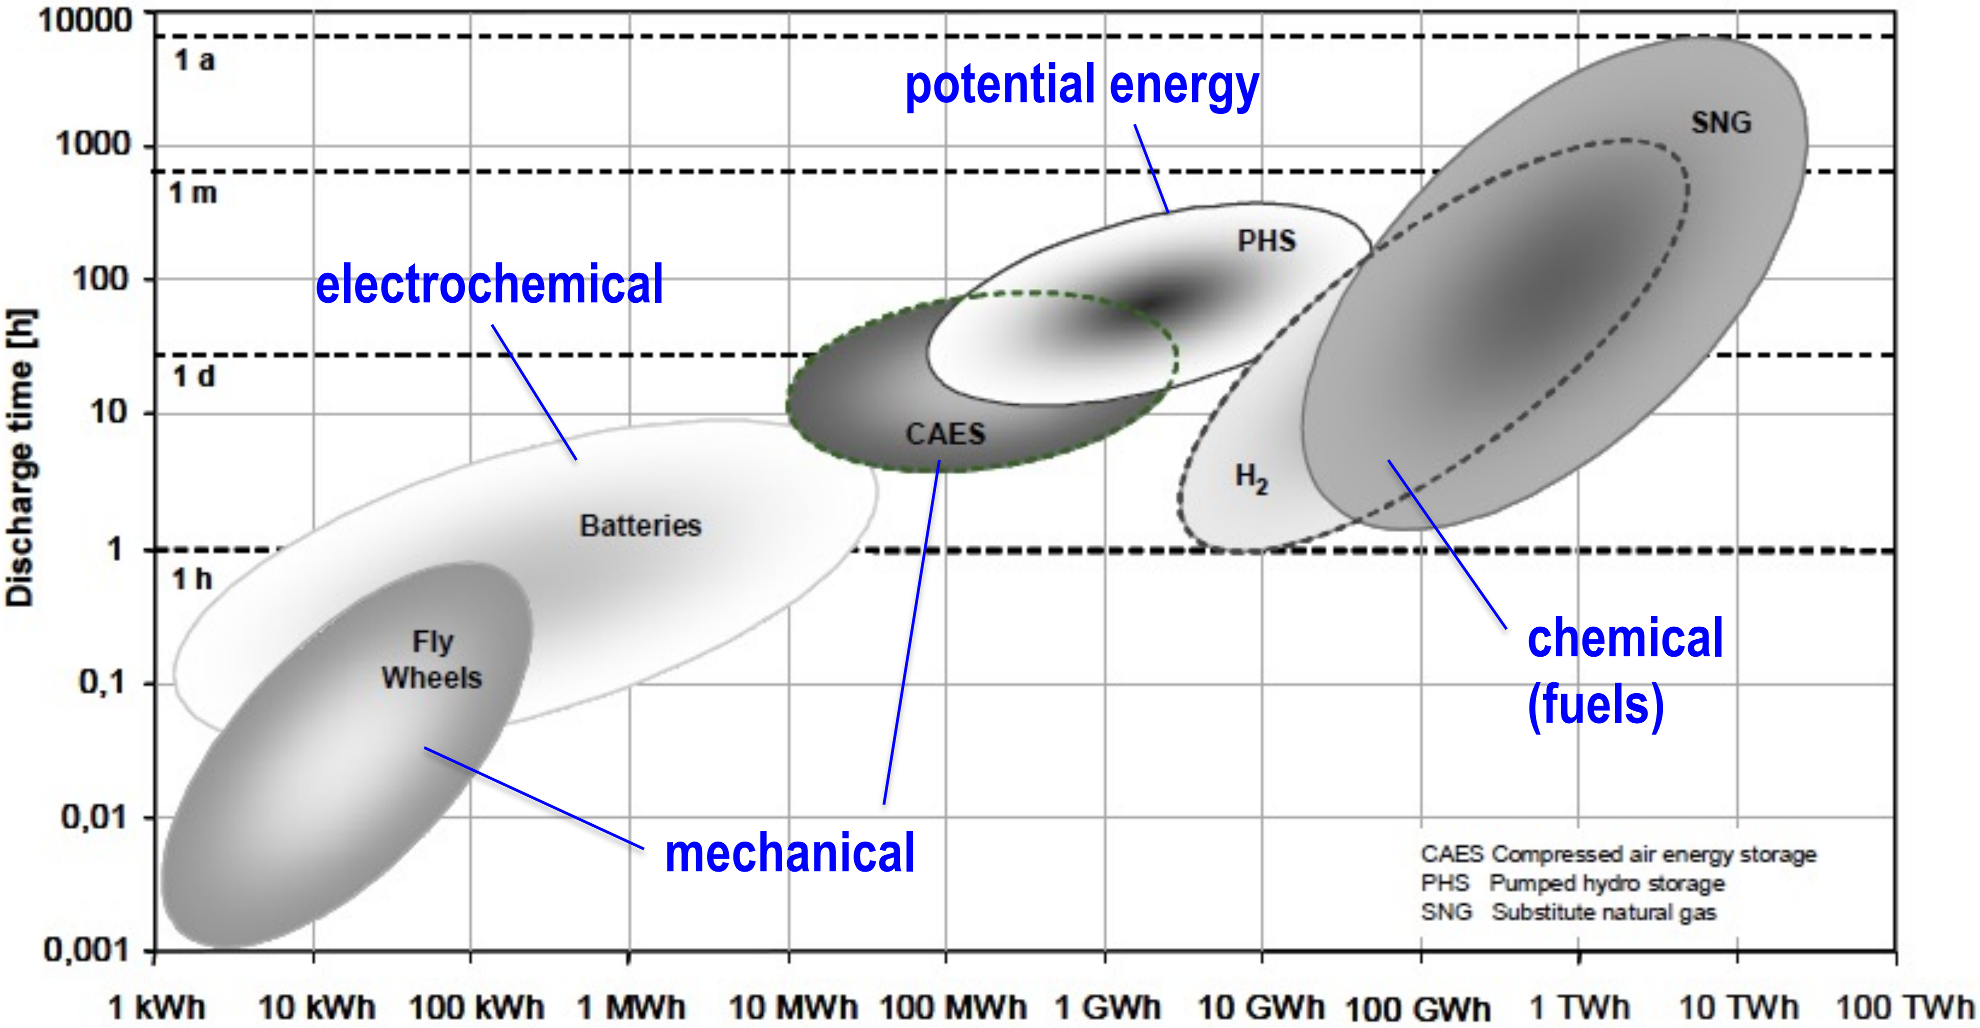
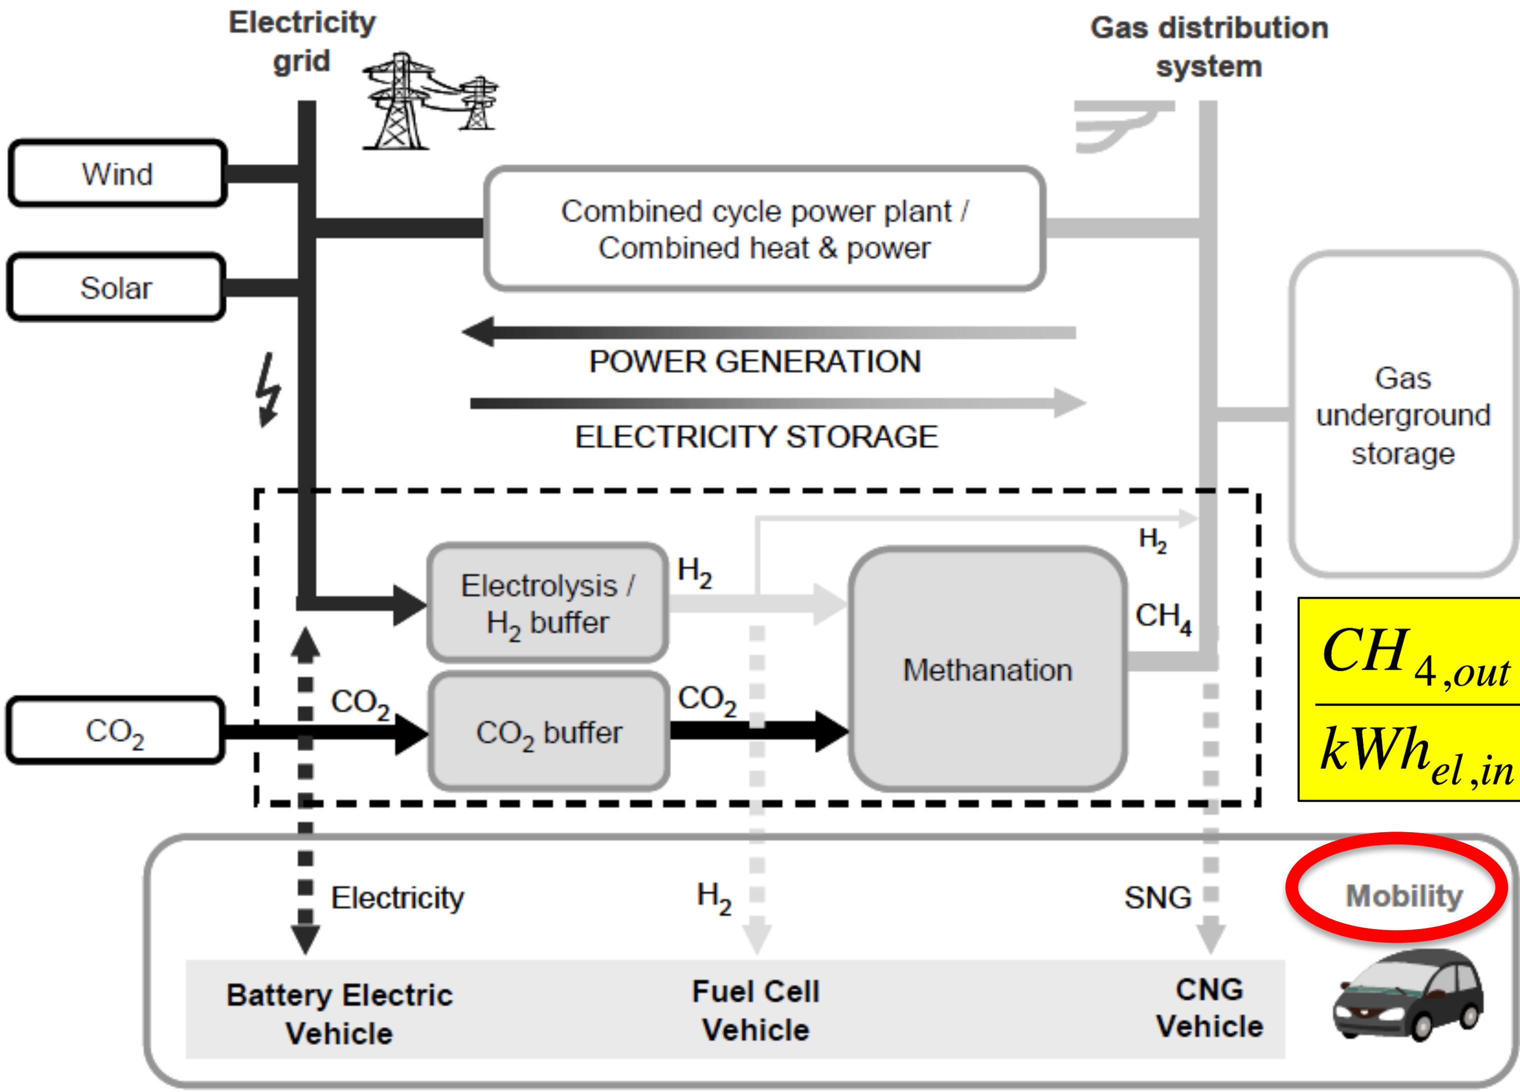
Storage schemes overview



Storing Renewable Energy in the Natural Gas Grid, Methane via Power-to-Gas (P2G): A Renewable Fuel for Mobility
M. Specht, U. Zuberbühler, F. Baumgart, B. Feigl, V. Frick, B. Stürmer, M. Sterner, G. Waldstein, ZSW-Ulm

→ converting electricity to fuel gives the largest capacities

‘Power-to-Gas’ concept



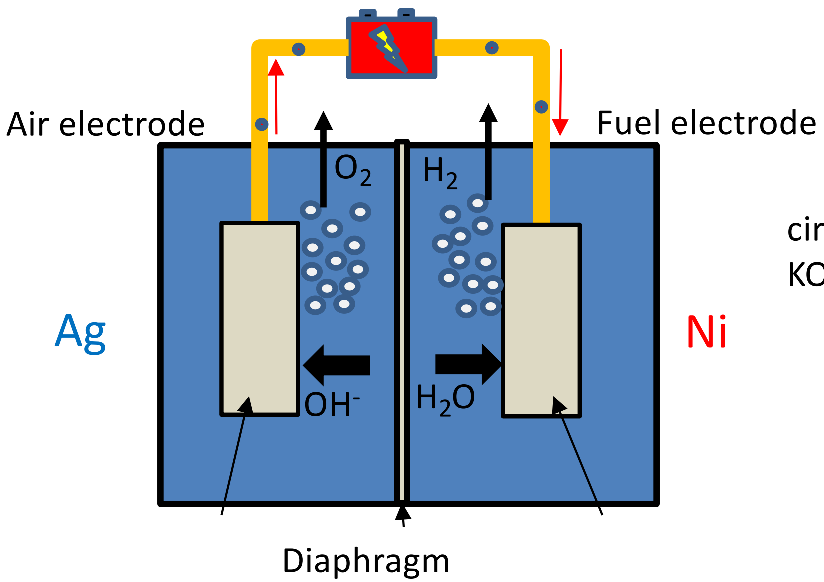
$$\frac{CH_{4,out}}{kWh_{el,in}} \geq 60\%$$

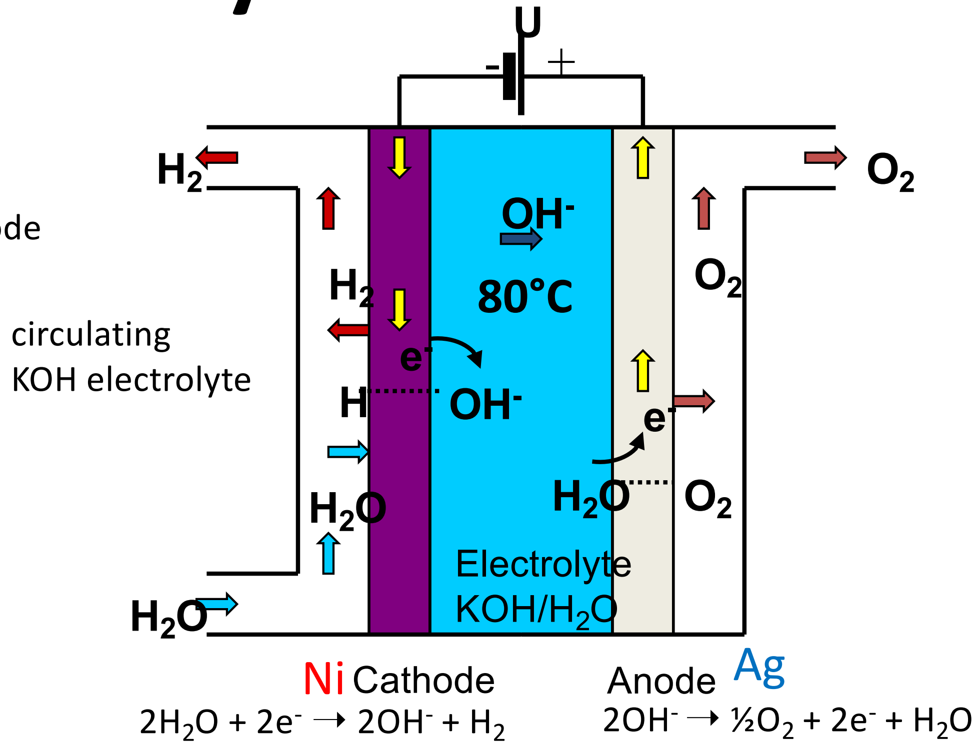
Storing Renewable Energy in the Natural Gas Grid, Methane via Power-to-Gas (P2G): A Renewable Fuel for Mobility
M. Specht, U. Zuberbühler, F. Baumgart, B. Feigl, V. Frick, B. Stürmer, M. Sterner, G. Waldstein, ZSW-Ulm

Electrolyser technologies

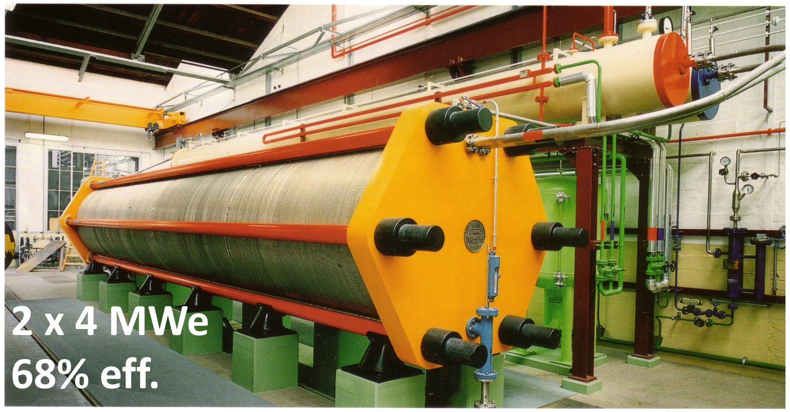
- AEL : alkaline water
- AEMEL : anionic exchange membrane
- PEMEL : proton exchange membrane (water)
- SOEL : solid oxide ceramic (steam)
- PCCEL : proton conducting ceramic (steam)

1. Alkaline electrolysis





1– 30 bar



Monthey (VS)

Advantages :

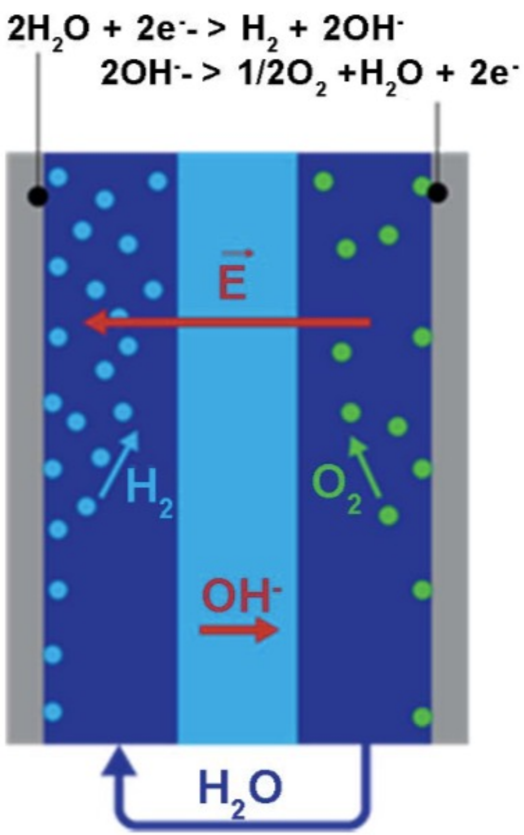
- Mature technology
- Large capacity (1400 Nm^3/h)
- Low cost
- Long life

Limitations:

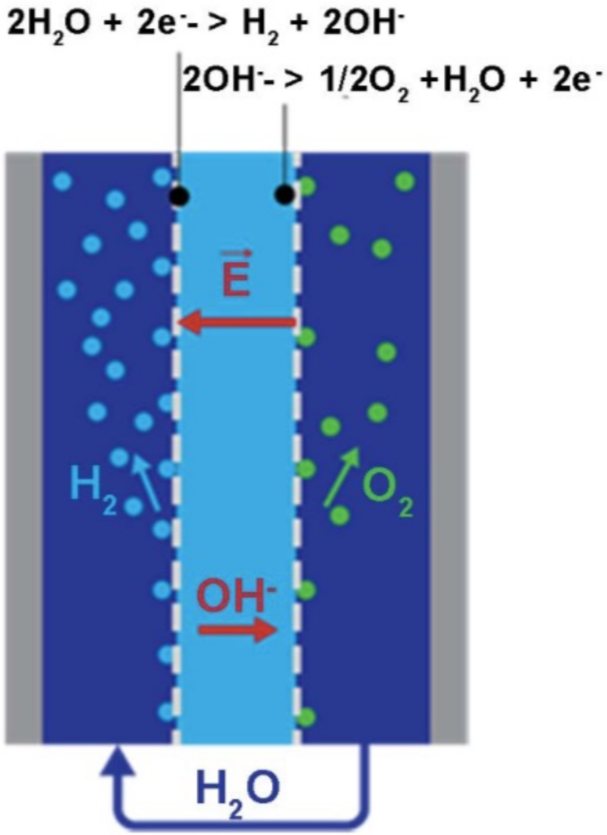
- Low current density
- Limited load range
- Limited dynamics
- Gas crossover at higher p

slide adapted from T.Macherel, Prof A. Züttel, EPFL

Electrolyte Resistance and Gas Bubbles



alkaline electrolyzer



zero-gap alkaline electrolyzer

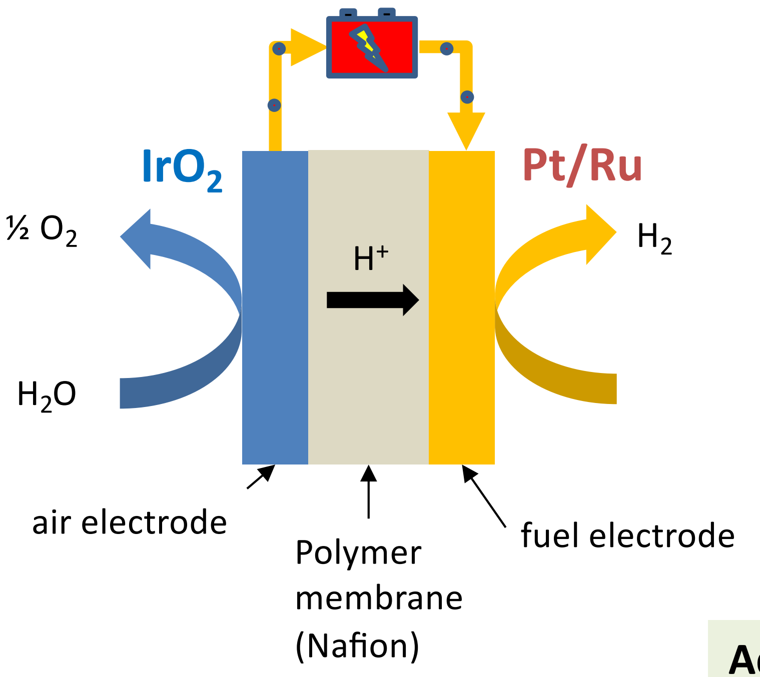
slide from Prof A. Züttel, EPFL

2. Polymer electrolyte membrane electrolysis



At air electrode (anode) :

$$H_2O_{(l)} \rightarrow \frac{1}{2}O_{2(g)} + 2H^+ + 2e^-$$

At fuel electrode (cathode) :

$$2H^+ + 2e^- \rightarrow H_{2(g)}$$

Advantages :

- High current density
- Wide load range
- Fast dynamics

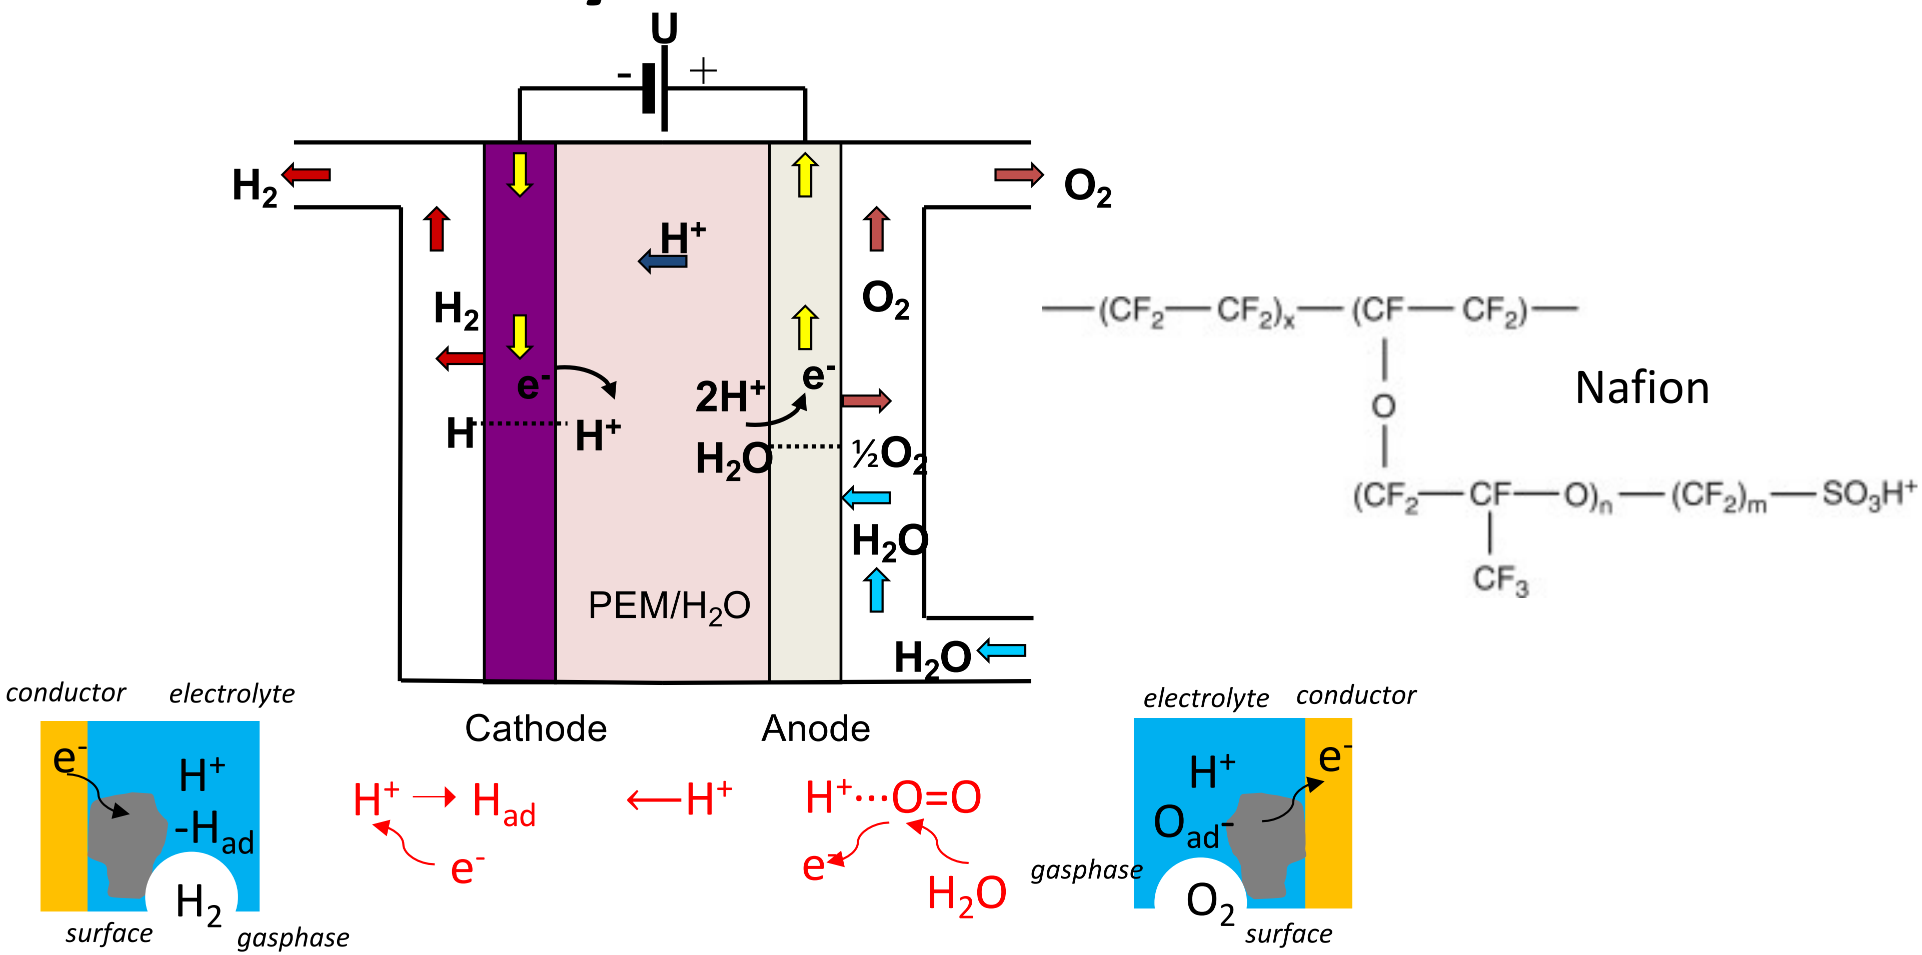
Limitations:

- scarce and expensive **materials** (noble metal catalysts; treated Ti interconnect)
- gas crossover

slide from T.Macherel, EPFL

PEM electrolyser

slide from Prof A. Züttel, EPFL



PEMEL started in the 1960s with the development of proton-conducting **acid** polymers, mainly perfluoro sulfonic acid (PFSA) polymer, among which the commercially established **NAFION**.

The sulfonic acid groups in the polymeric structure make the electrolyte **acidity very high** such that **only noble metal catalysts (**Pt, Ru, Ir), are able to sustain this environment. This increases PEMEL cost. For the membrane to be ionically conductive, it must be wet; furthermore, backward penetration of oxygen molecules may occur, which accounts for about 5% electric current consumption.

HALDOR TOPSØE

Thermodynamics of splitting steam vs water

	Reaction	ΔH (kJ/mol)	MJ / Nm^3	kWh / Nm^3
Water	$H_2O(l) \Rightarrow H_2 + \frac{1}{2}O_2$	286	12.77	3.55
Steam	$H_2O(g) \Rightarrow H_2 + \frac{1}{2}O_2$	242	10.80	3.00
	$CO_2 \Rightarrow CO + \frac{1}{2}O_2$	283	12.63	3.51

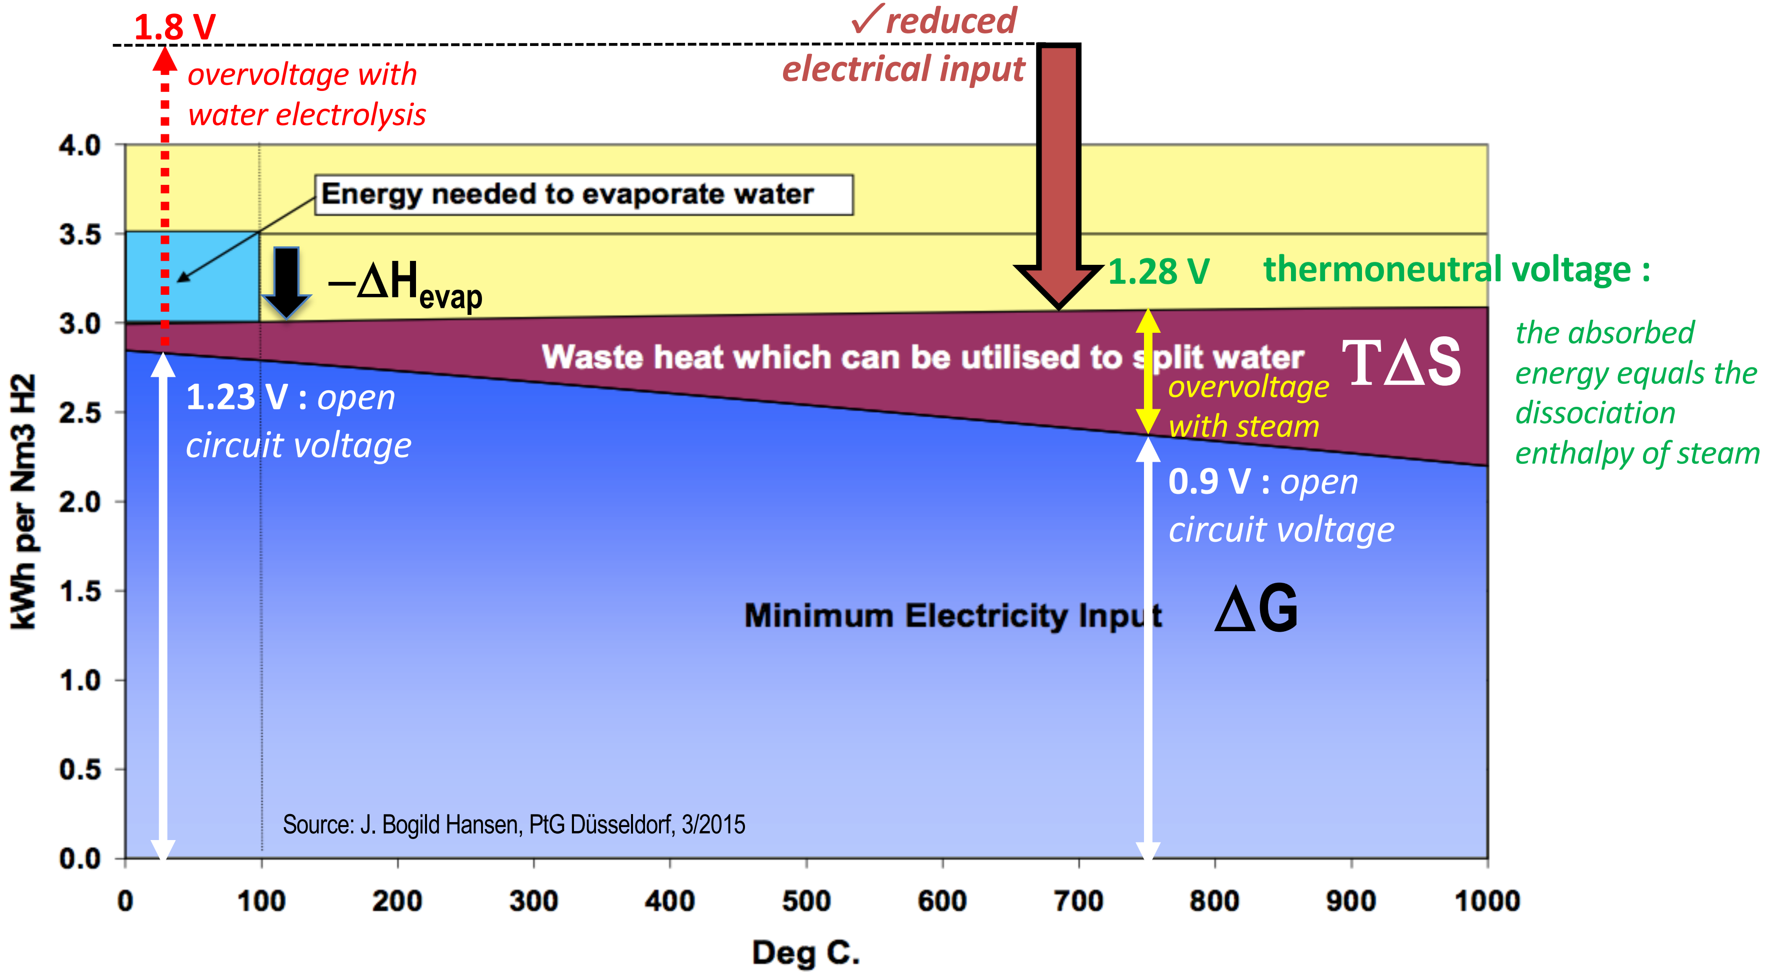
$-\Delta H_{evap}$

Electrolysis : energy necessary for dissociation

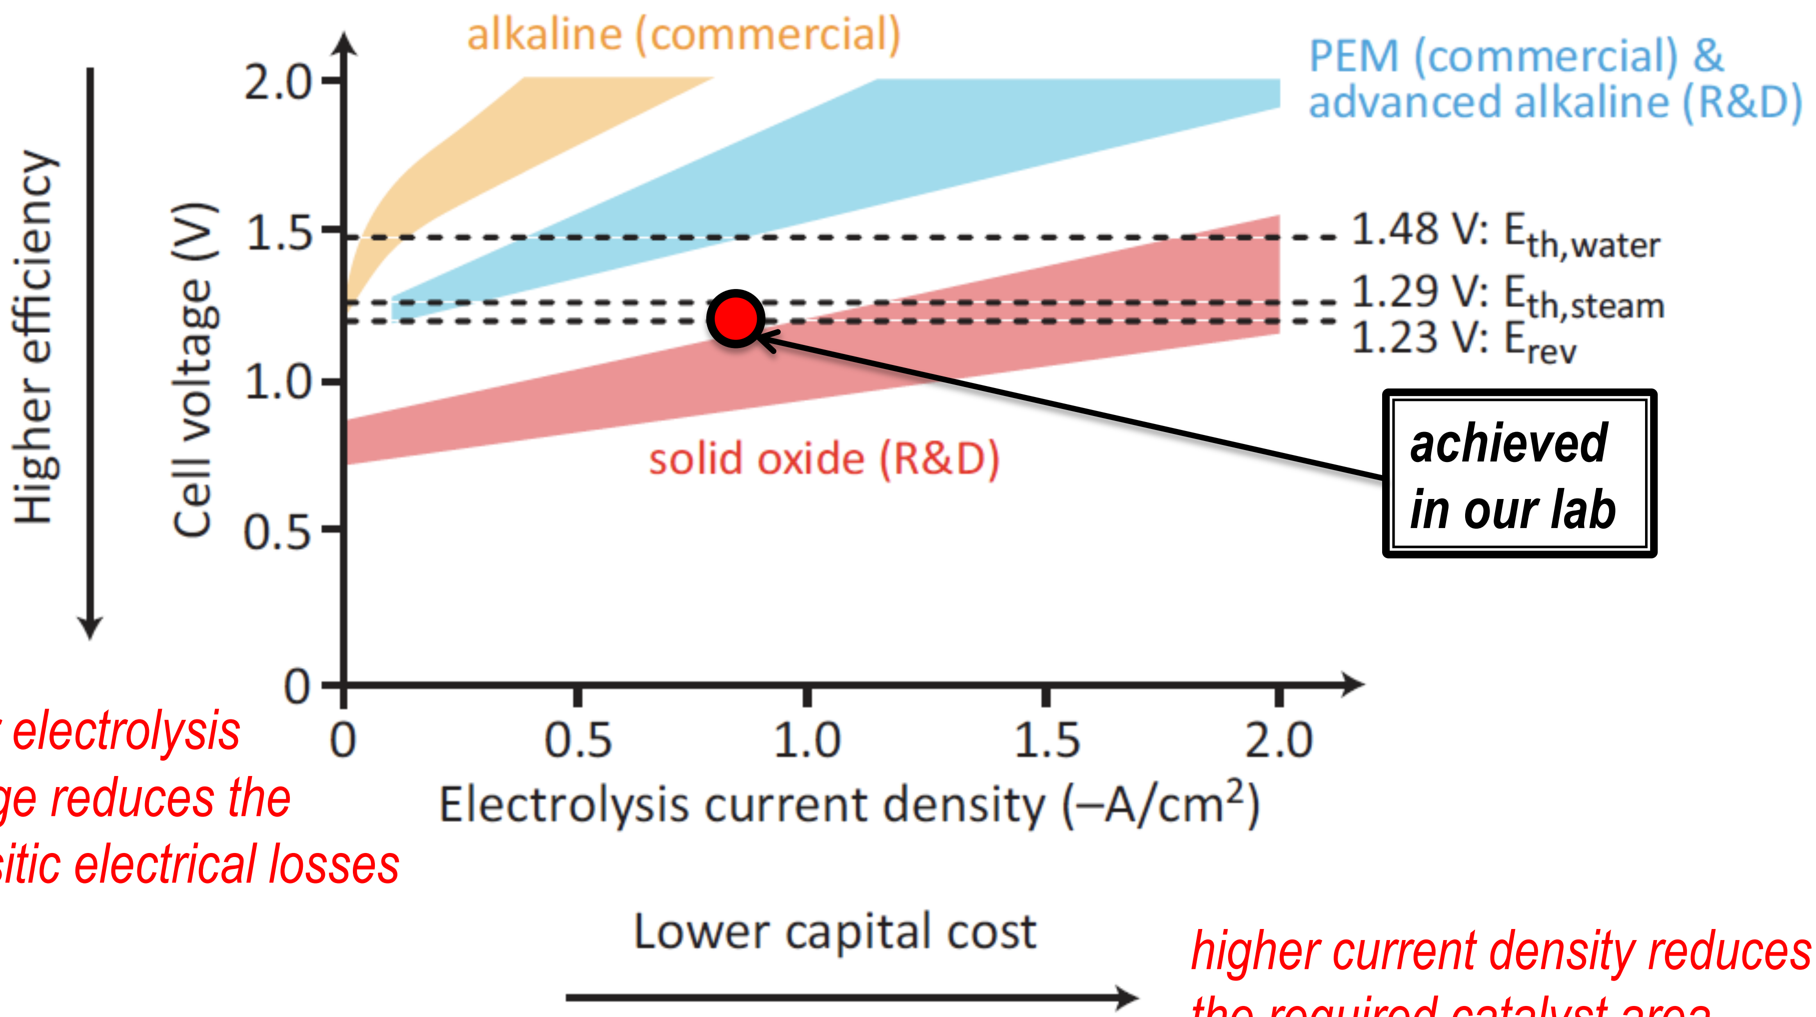
Combustion: energy liberated as heat

Why *steam* electrolysis?

$$\Delta H = \text{total energy} = \text{electricity} + \text{heat} = \Delta G + T\Delta S$$



Electrolysis technology comparison

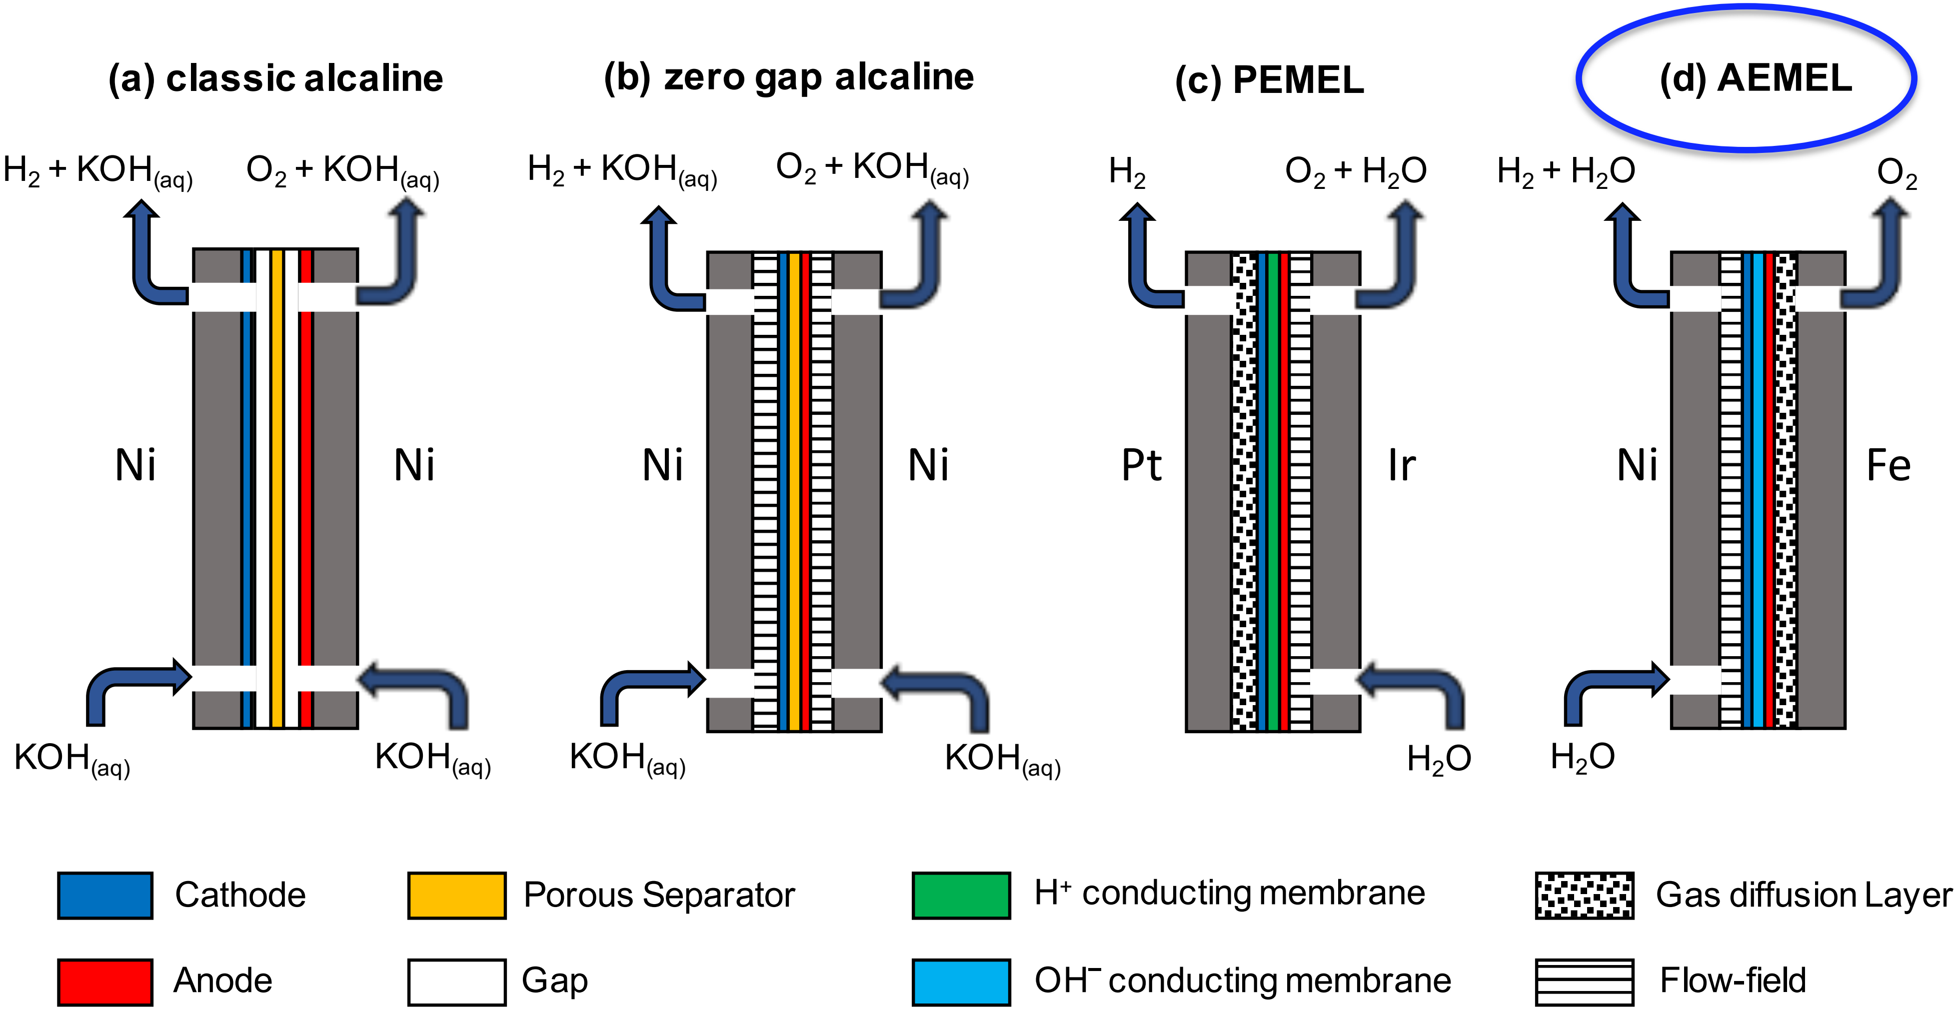


lower electrolysis voltage reduces the parasitic electrical losses

higher current density reduces the required catalyst area

Sustainable hydrocarbon fuels by recycling CO2 and H2O with renewable or nuclear energy
Christopher Graves, Sune D. Ebbesen, Mogens Mogensen, Klaus S. Lackner
Renewable and Sustainable Energy Reviews 15 (2011) 1–23

4. Recent : AEM
(anionic exchange membrane electrolysis)



(graph : Dr Heron Vrubel)

AEMEL : combination of PEMEL and classical alcaline

Advantages: no noble metal catalyst, no expensive Ti bipolar plates

5. Recent: proton conducting ceramic electrolyser (PCCEL)

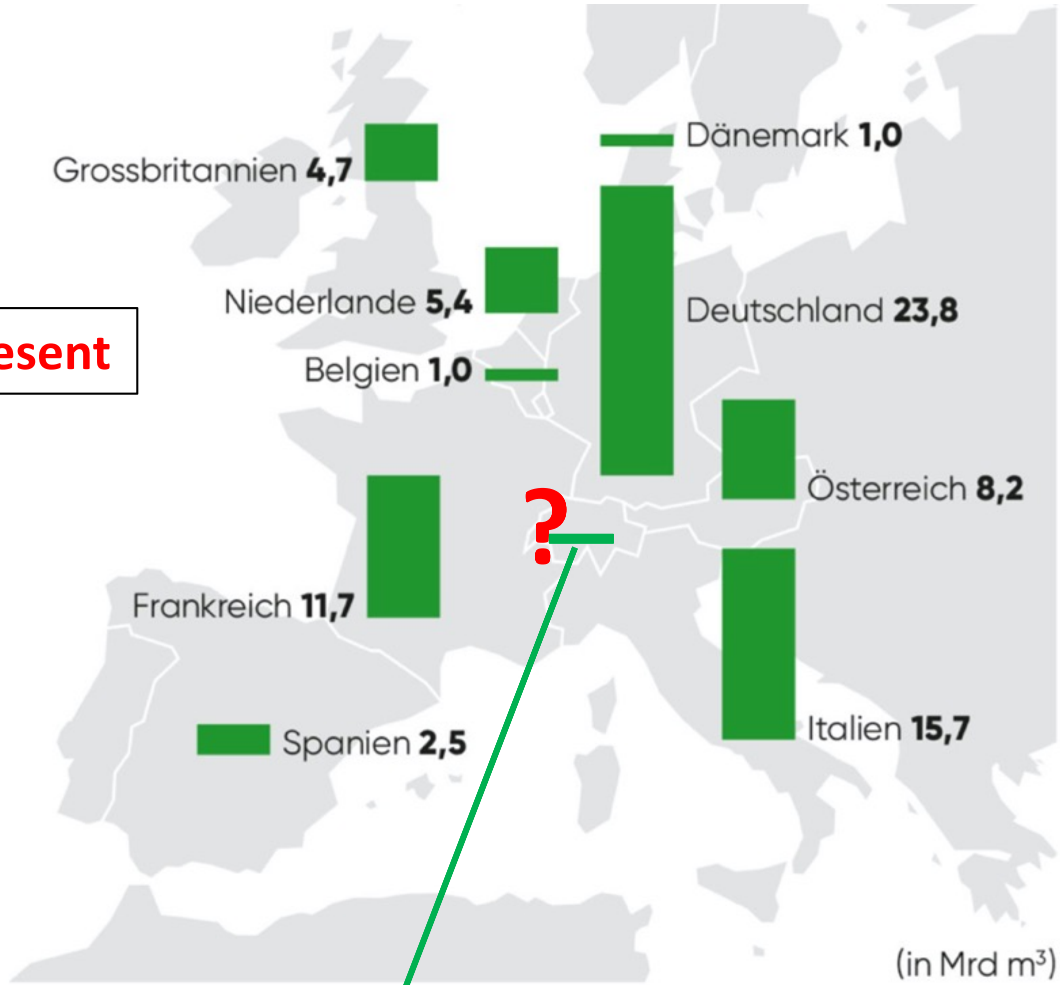
P2G : H_2 or CH_4?

H_2	CH_4
• 1-step synthesis • mobility without CO_2	• 2-step synthesis • Need CO_2 source • Heat management
• Limited injection in gas grid • Compression & transport loss • Difficult to store	• No limit for gas grid injection • Low compression/transport loss

Seasonal gas storage in Switzerland?

https://gazenergie.ch/de/wissen/detail/knowledge-topic/7-erdgas-speicher/

no NG storage at present



10 TWh of NG require 14 TWhe of electricity, expected to be coverable from future 30-60 TWhe of PV and 40 TWhe of hydro

with 1 bio m^3 gas (10 TWh), the Swiss winter electricity gap would be covered (i.e. a deficit of ~1 TWhe / month).

H_2 storage methods

- as compressed H_2 gas (=> 1000 bar)
- as liquid H_2 (1 bar)
  - optional: further cryocompression of liq H_2
- as physically adsorbed H_2-layer on high surface area materials
  - sorption increases at low T
- as H in hydrides
  - solid solution → hydride H (interstitial H up to intermetallic)
  - complex hydrides (e.g. $NaBH_4$)
- as H in other chemical compound
  - LHOC (liquid hydrogen organic carrier)
  - NH_3 etc.

H_2 storage overview

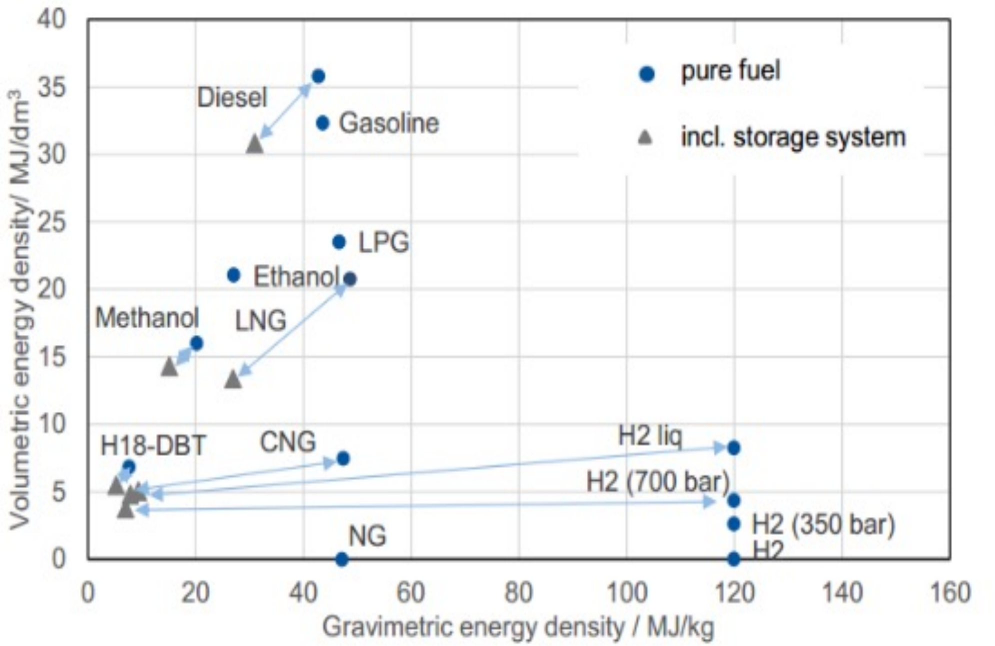
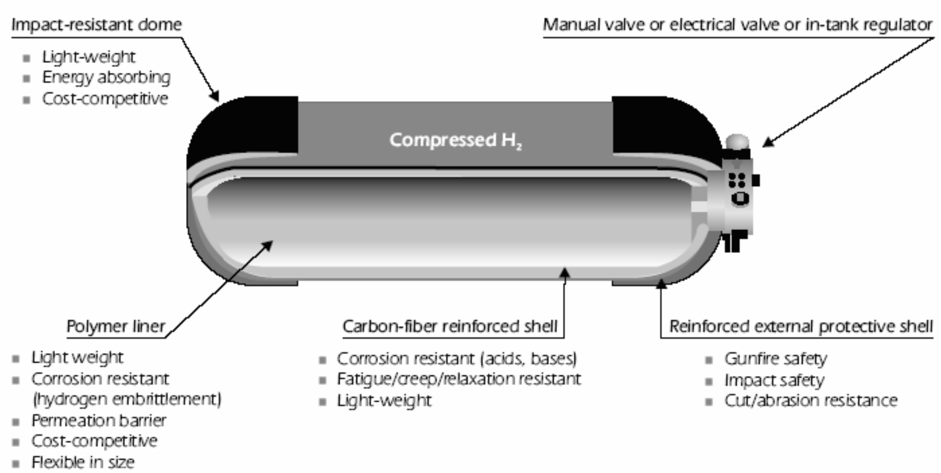
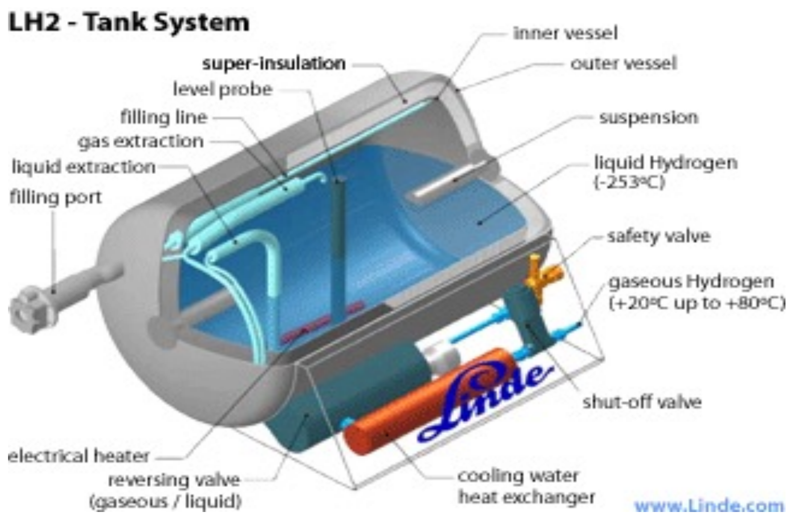
3. Pipelines
4. Other methods





loss 0.1 – 3% / day



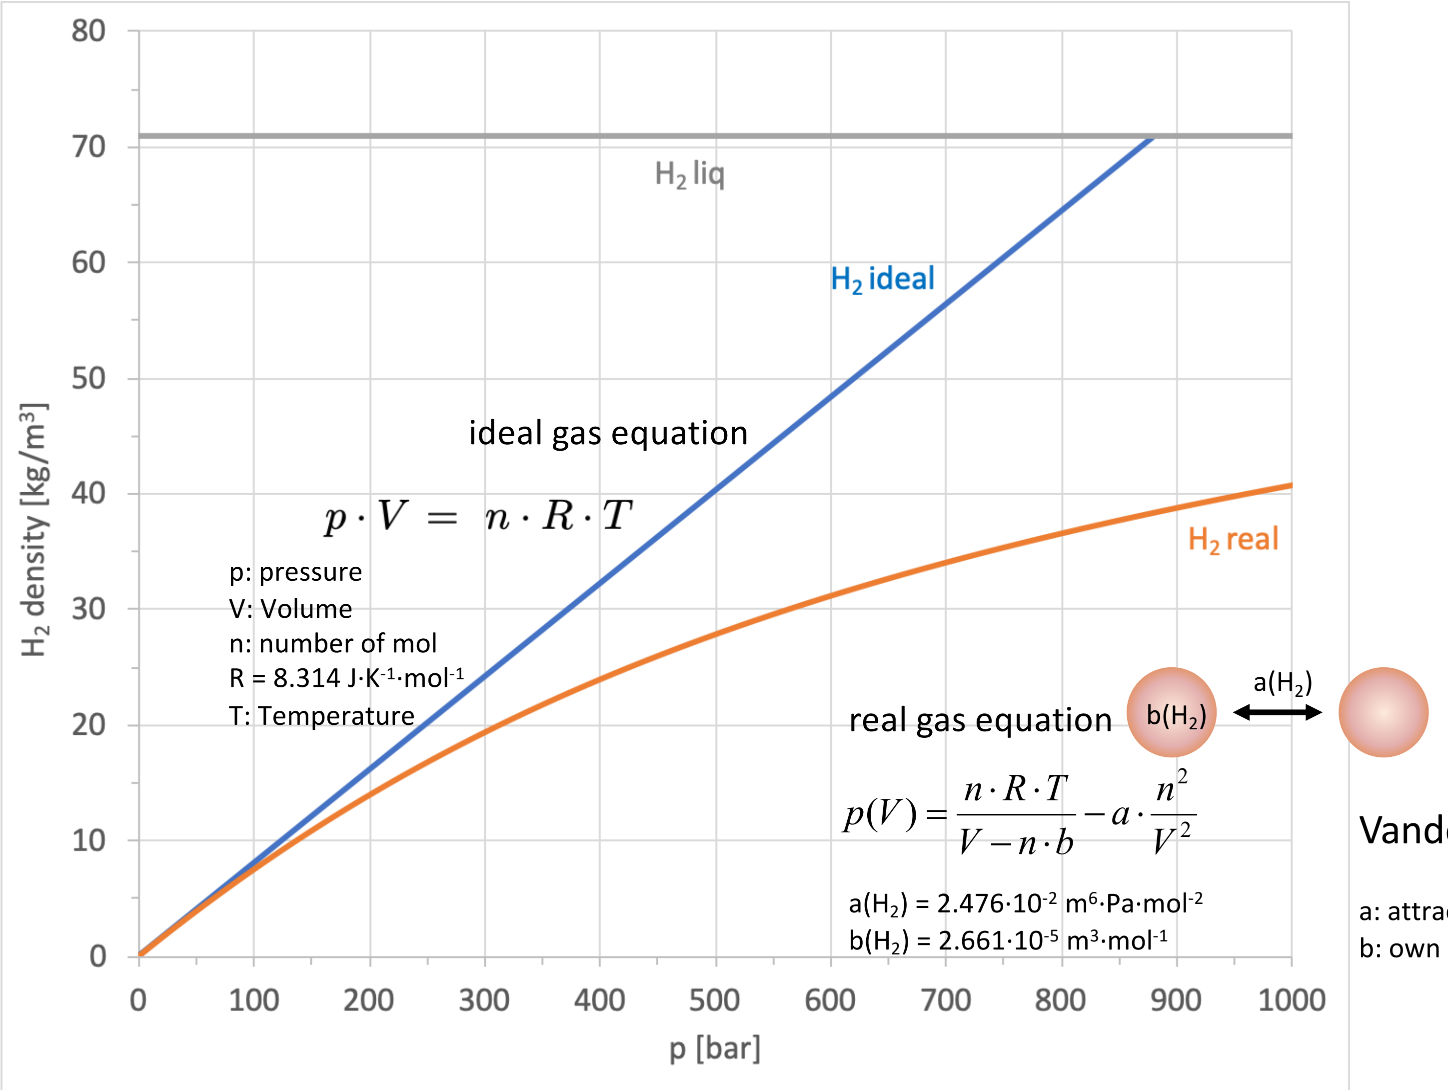
fuel density (kg^{-1}) alone is high;
not when adding storage medium weigth

(figures: Leonardo Gant)

Pressurized H_2

1 bar = 2 g / 22.4 L = 90 g /m³
ideal gas: 1000 bar = 90 kg/m³

(water : 1000kg/m³ !)



ideal gas equation

$$p \cdot V = n \cdot R \cdot T$$

p: pressure
V: Volume
n: number of mol
R = 8.314 J·K⁻¹·mol⁻¹
T: Temperature

real gas equation

$$p(V) = \frac{n \cdot R \cdot T}{V - n \cdot b} - a \cdot \frac{n^2}{V^2}$$

$a(H_2) = 2.476 \cdot 10^{-2}\ m^6 \cdot Pa \cdot mol^{-2}$
$b(H_2) = 2.661 \cdot 10^{-5}\ m^3 \cdot mol^{-1}$

VanderWaals gas

a: attraction term btw molecules
b: own volume of the molecules

slide from Prof A Züttel, EPFL

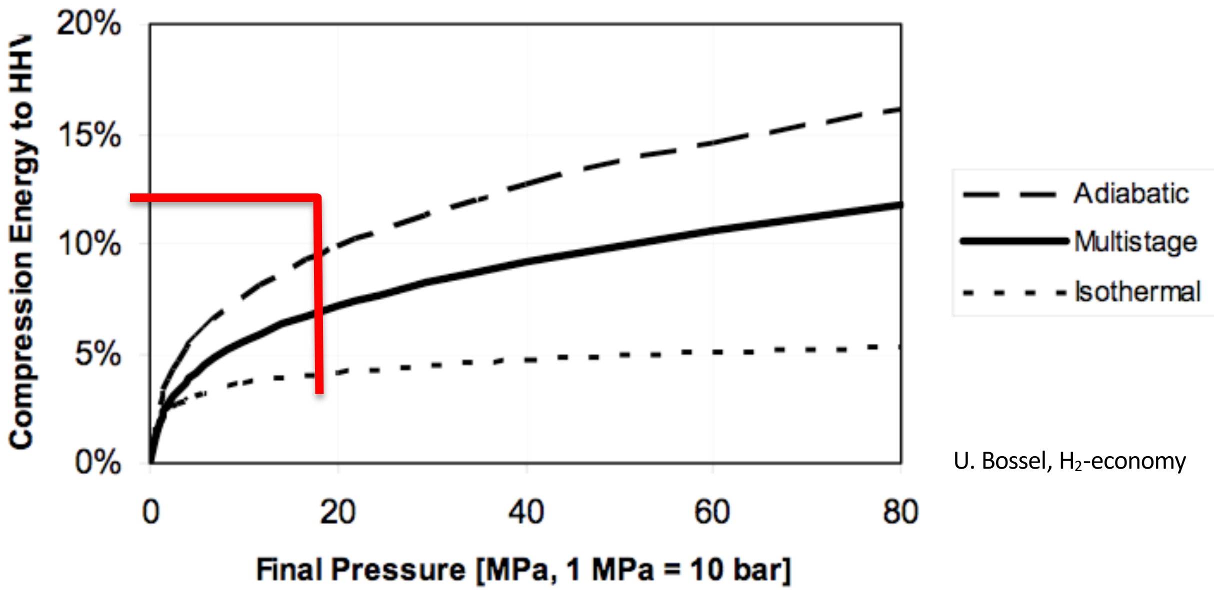
Compression work

- ideal isothermal $work_{id}$ (J/kg) = $p_0V_0 \ln(p_1/p_0)$
- adiabatic $work_{ad}$ = $(\gamma/\gamma-1)\, p_0V_0\, ((p_1/p_0)^{(\gamma-1)/\gamma}-1)$

V_o initial volume(m^3/kg) (11.11 m^3/kg for H_2, 1.39 m^3/kg for CH_4)

p_0 initial pressure, p_1 final pressure, $\gamma = C_p/C_v$ (1.41 for H_2, 1.31 for CH_4)

- @200 bar (W_{ad}): for CH_4 2 MJ/kg (2% HHV), for H_2 14 MJ/kg (10% HHV)



U. Bossel, H_2-economy

Joule-Thomson coefficient

isenthalpic expansion/compression:

$$\mu_{J-T} = \left(\frac{dT}{dP}\right)_{H} = -\frac{(\alpha T - 1)V}{C_P}$$

α : expansion coefficient at const. P

C_P : heat capacity at const. P

$\mu_{J-T} > 0$

positive J-T-coefficient

@ low P:
the gas cools upon expansion

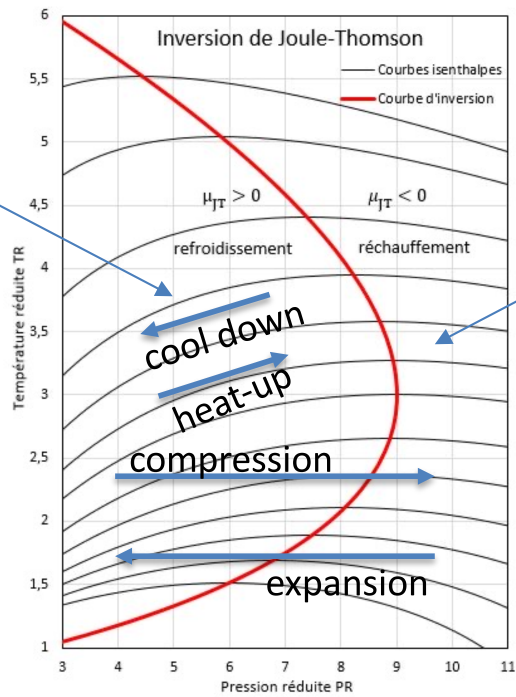
μ_{J-T} = 0 for an ideal gas
no T-change during J-T-expansion

$\mu_{J-T} < 0$

negative J-T-coefficient

@ high P:
the gas heats upon expansion

(expansion accelerates the molecules,
$h_{total} = h_{static} + c^2/2$; due to high speed of light molecules,
friction heating dominates the expansion cooling)

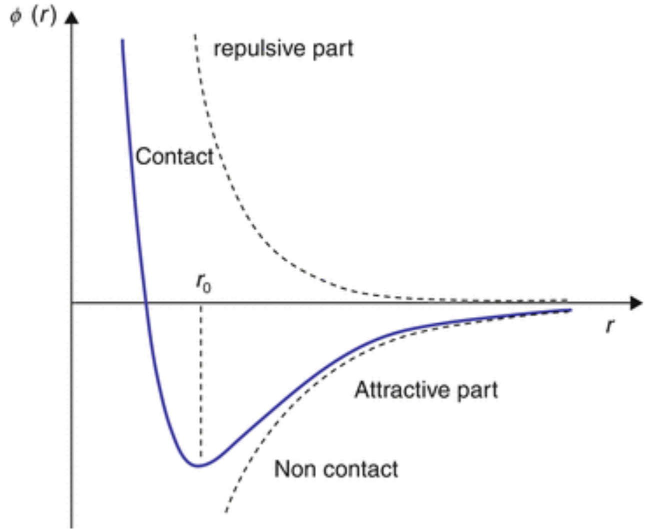


The gas can therefore be cooled (and eventually liquified), only
- by expansion if $\mu_{J-T} > 0$
- by compression if $\mu_{J-T} < 0$

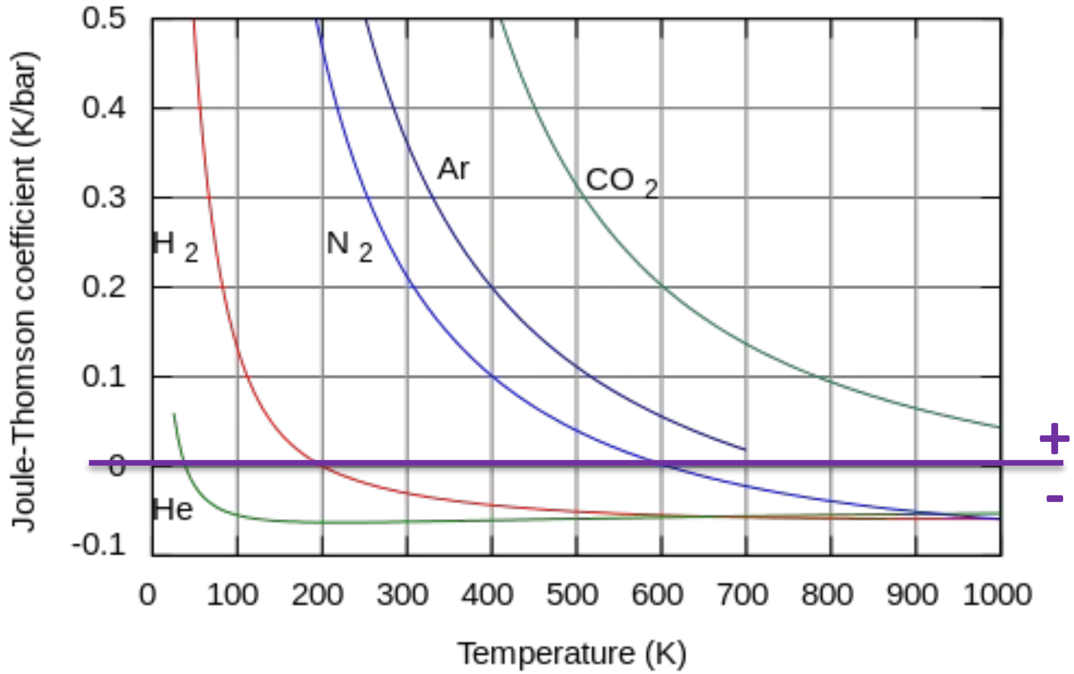
⇒ for H_2-filling (400 bar=>350 bar), cooling is needed !

Joule-Thomson Effect

$$\mu_{\mathrm{JT}} = \left(\frac{\partial T}{\partial p}\right)_H$$



Van der Waals



$$\mu_{\mathrm{JT}} = \frac{1}{C_p} \cdot \left(\frac{2a}{RT} - b\right) \qquad T_{\mathrm{inv}} = \frac{2a}{Rb}$$

$a(H_2) = 2.476 \cdot 10^{-2}$ $m^6 \cdot Pa \cdot mol^{-2}$
$b(H_2) = 2.661 \cdot 10^{-5}$ $m^3 \cdot mol^{-1}$
$R = 8.314$ $J \cdot K^{-1} \cdot mol^{-1}$

$\boxed{\Rightarrow T_{inv} = 200K}$

At ambient T, H_2 must be cooled for filling (expansion), and heated when compressing.
At cryo-conditions (e.g. 77K and lower), it is the opposite.

slide from Prof A Züttel, EPFL

Review of hydrogen compression technologies

G. Sdanghi, G. Maranzana, A. Celzard, V. Fierro, "Review of the current technologies and performances of hydrogen compression for stationary and automotive applications", Renewable and Sustainable Energy Reviews 102 (2019), pp. 150 – 170

@1 atm

highest gravimetric density:	140	MJ/**kg**	(496.0 moles)
lowest volumetric density:	0.011	MJ/**L**	(1/22.4th of a mole = 0.0446 mole)

H_2 compression technologies overview

- Mechanical: **volume flow** for H_2 is confined by a displacement device
  1. reciprocating piston
  2. diaphragm
  3. linear (magnetic)
  4. ionic liquid
- Non-mechanical : specifically designed for H_2 application
  1. cryogenic
  2. electrochemical (**mass flow**)
  3. adsorption (thermal)
  4. metal-hydride (thermal)

In terms of H_2-economy ('pack, distribute, store, deliver'), the cheapest solution today is:
H_2-gas compression + truck-delivery (for small stations); in carbon-/glass fiber storage tanks to reduce weight:
best values 1-2wt% @250 bar (steel), to 6wt% @700 bar (composite), and 30g H_2/L
(still below the US-DOE targets of 40 g/L and 5.5wt%)

Non-mechanical compressors

- Cryogenic compression of liquefied H_2
- Electrochemical compression
- Thermally driven:
  - Adsorption of H_2 on high surface materials
  - Metal-hydride

Liquefaction work

As Carnot cycle with a heat sink at 300 K, the ideal work of liquefaction is W_L = 13 MJ kg^{-1} (3.6 kWh kg^{-1}) for LH_2

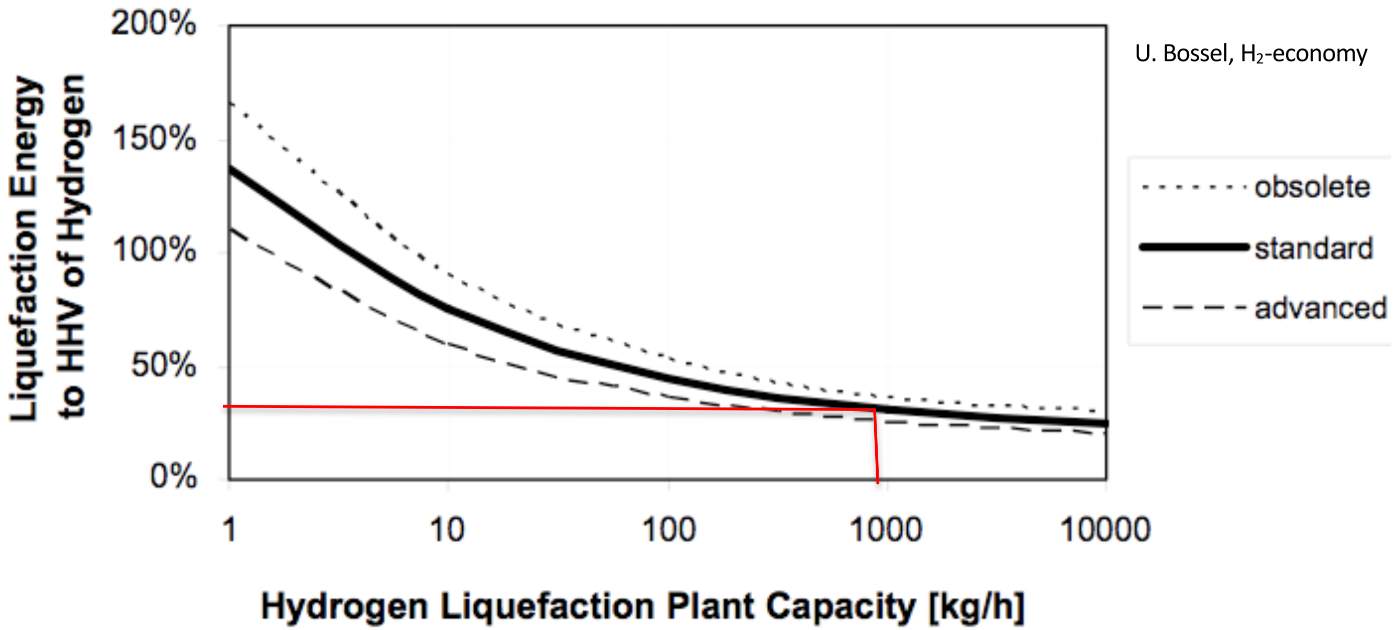
300K

$$W_{\mathrm{L}} = \Delta H \frac{(T_{\mathrm{a}} - T_{\mathrm{e}})}{T_{\mathrm{e}}}$$

225 kJ/kg (evap)
+703 kJ/kg (ortho-para)

20K

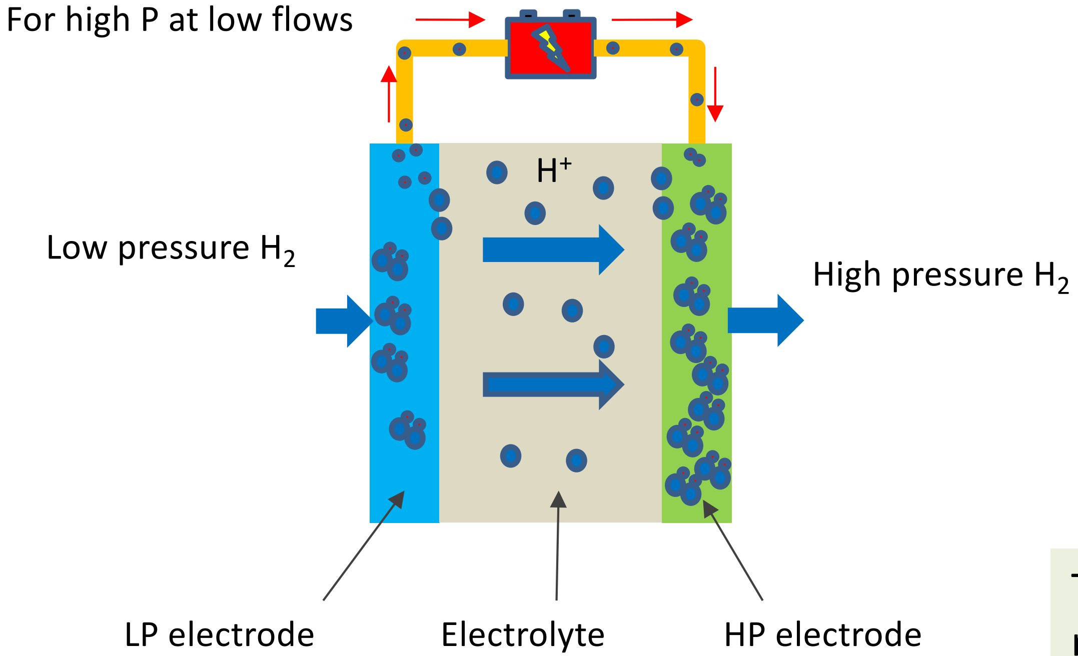
298 K → 20 K	MJ need per kg liquid H_2	Reference
theoretical requirement	13 (10% of HHV)	Carnot
usual scale	54	182 kg / h, Linde plant (D)
large scale	36	2000 kg / h, USA
ultimate scale	30-25	12000 kg/h, study case



U. Bossel, H_2-economy

Liquifaction of H_2 is very energy intense (about 30% lost)

Electrochemical 'pump'



slide from T Macherel, EPFL

At LP electrode:

$$H_2(LP) \rightarrow H^+ + 2e^-$$

At HP electrode:

$$H^+ + 2e^- \rightarrow H_2(HP)$$

Minimum voltage:

$$E_{rev} = \frac{RT}{zF} \ln\left(\frac{p_{HP}}{p_{LP}}\right)$$

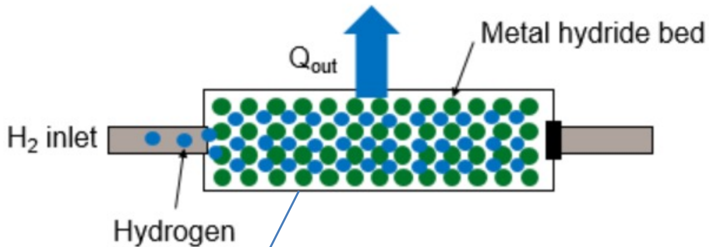
13mV

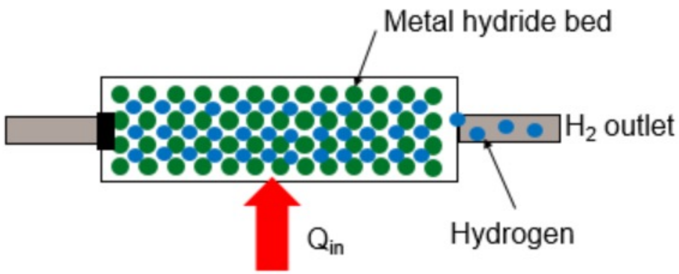
Theoretically only 84 mV needed to raise from 1 to 700 bar. (ln(700)=6.55)
However, ohmic drop and overpotentials increase the voltage.
Achieved: 140 mV for 50 bar @0.2A/cm^2
=> 0.3 kWh/Nm^3 v. low consumption

Metal hydride compression

$$M_{(s)} + \frac{x}{2} H_{2(g)} \underset{des}{\overset{abs}{\leftrightarrow}} MH_x + Q$$

Hydride heats up during absorption
=> needs heat removal





Steel tank.
Tubular for easy heat/mass transfer

Heat supply increases the storage pressure

slide from T Macherel, EPFL

Linde AG presentation EFCF July 2019: Industrial perspective on H_2 purification, compression, storage and distribution

Summary on H_2

- Regarded as important intermediate energy vector, because:
  1. it can store large quantities of renewable electricity (wind, PV, …) via electrolysis technologies
  2. it can be used in all sectors (industry, heating, power, mobility)
- Most interest now for (heavy duty) mobility and (heavy) industry
- Different electrolyser technologies will likely co-exist. The main challenges are:
  1. large scale deployment (TWe capacity will be needed) : manufacturing, materials, footprint
  2. storage, and transport, of H_2 (volume, weight)
  3. Compression and liquefaction are very energy intense; alternative compression technologies specific to H_2 are being developed. H_2 as very light gas has a negative Joule-Thomson coefficient at ambient T.

A potential roadmap of Power-to-X technologies

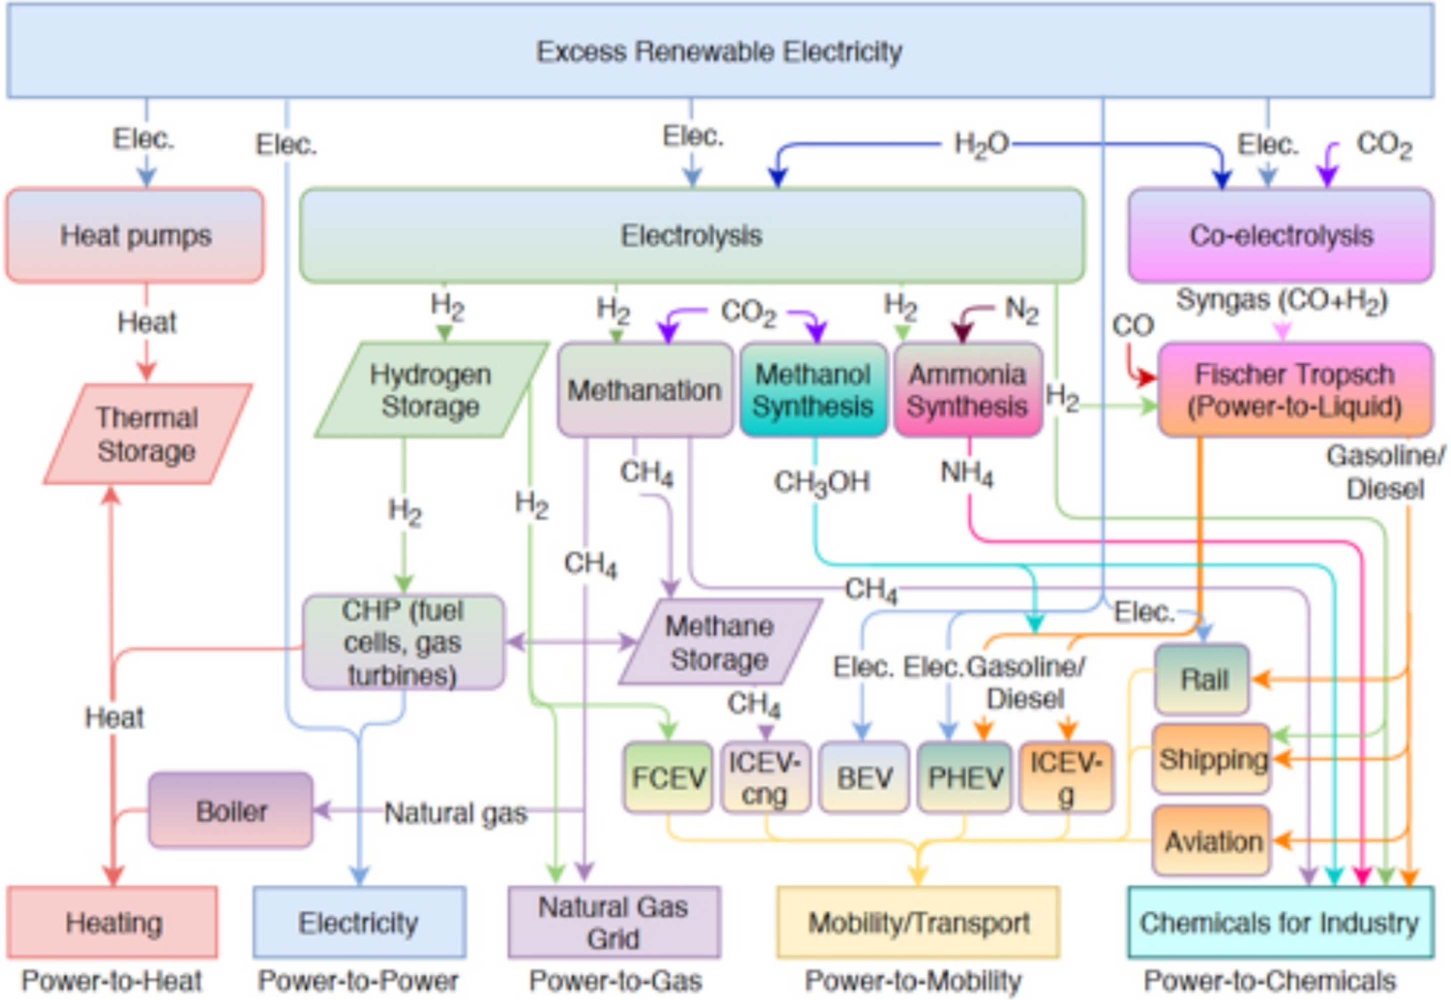

Figure 1.1 – Schematic representation of the power-to-X concept. Reprinted from [1].

Portia Murray. The Role of Power-to-X Technologies in Decentralised Multi-Energy Systems. Doctoral Thesis, ETH Zurich, 2020. URL https://www. research-collection.ethz.ch/handle/20.500.11850/403923. Accepted: 2020-03- 09T10:43:39Z.

Reminder about the exam

- Saturday June 28th 9h15-12h15 – sorry 🫣
- Room CE 1 6
- Only bring the formula memento, a calculator and a pen
  - do not write anything extra on the formula memento
- No electronic communication devices
- Multiple choice questions on general understanding (principles, pro's/con's, comparisons, applications)
  - Wrong answers are not counted negative
  - the exception is when there are multiple correct answers possible in a question (to avoid that you tick too many boxes to increase 'chances')
- ~short calculation exercices
- Know the scales (orders of magnitudes) and efficiencies (%)
- Know how to handle and convert energy units (PJ, kWh, oil-equivalent,…)

have a look at our website for semester/master projects 🫠
