# Agenda

- [What is Jupyter?](#)
- [Jupyter Notebook](#)
  - [Requirements and installation](#)
  - [Code cells](#)
  - [Dropdown menus](#)
  - [Closing notebooks](#)
  - [Text cells and Markdown](#)
- [Jupyter Notebook and VS Code](#)

# What is Jupyter?

# Project Jupyter

- Link: [jupyter.org](https://jupyter.org)
- Open-source project for **interactive computing**
- Used in data science, machine learning, scientific computing, etc.
- Three dimensions of Jupyter [1]:
  - Interactive computing
  - Computational narratives
  - The idea that Jupyter is more than software
- The core of Jupyter is the Jupyter Notebook

# 1. Interactive Computing

*Interactive computation is a persistent computer program that runs with a "human in the loop", where the primary mode of interaction is through the same human iteratively writing/running blocks of code and looking at the results. [1]*

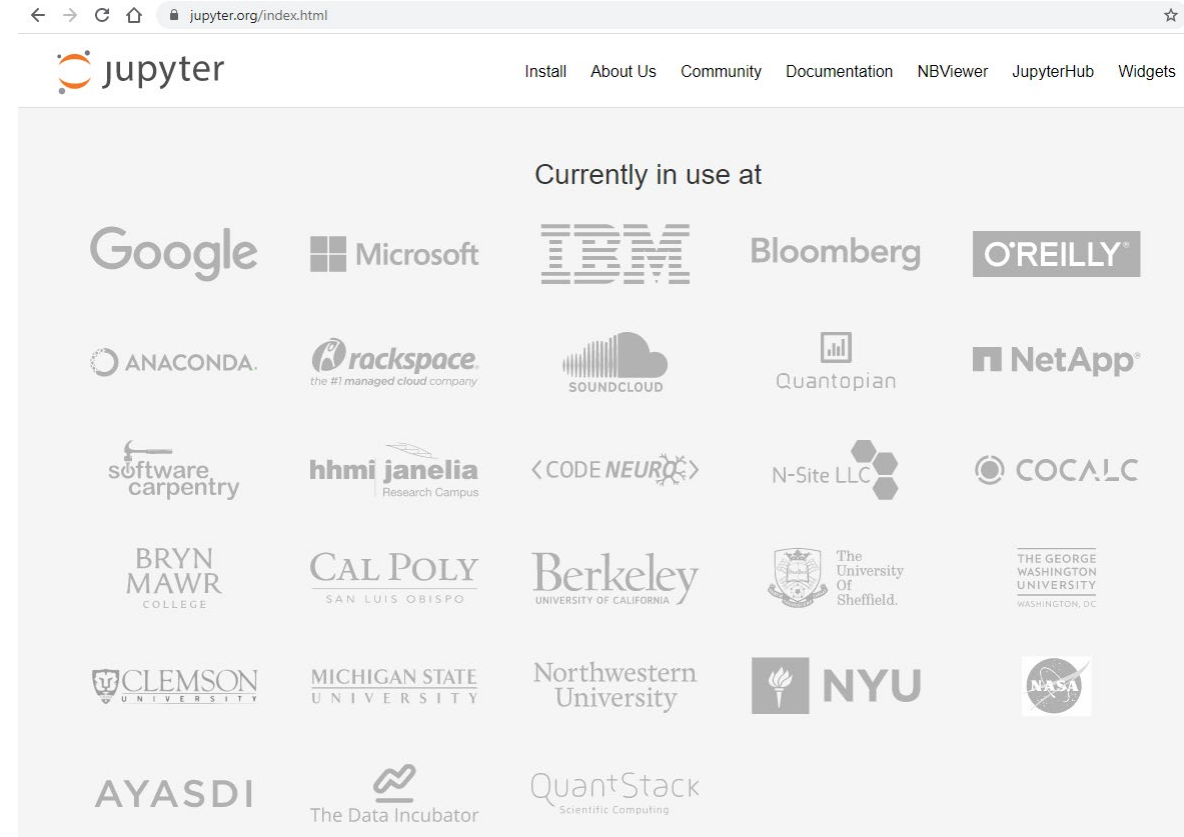

- Program has a working **memory**, which records the results of previous computations to make them available for subsequent ones
- User provides **input** to the program by writing **code** instead of using graphical or touch interfaces
- A single human is **both** the **user** and the **author** of the program

## 2. Computational Narratives

- Ability to create and share a story with code and data
- Making interactive computations reproducible (share code and data)
- Provide artifacts that can be shared with others in both the original as well as other forms (e.g., websites, books, online documentation, etc.)

# 3. More Than Software

- Jupyter is more than software
- It builds and consists of services, open standards and protocols, and community (e.g., VS Code, GitHub, and many more)
- Millions of users

# Jupyter Notebook

# Jupyter Notebook

*"Jupyter Notebook is an open document format and web application that enables users to compose and share interactive programs, which combine live code with narrative text, equations, interactive visualizations, images, and more." [1]*

Welcome to the Jupyter Notebook Server

WARNING

Don't rely on this server

Your server is hosted at

Run some Python

To run the code below:

1. Click on the cell to see the code

2. Press SHIFT+ENTER

A full tutorial for using the Jupyter Notebook

In [ ]:

```
matplotlib inline
import pandas as pd
import numpy as np
import matplotlib
```

jupyter

Lorenz Differential Equations

Python 3

File Edit View Insert Cell Kernel Help

Code Cell Toolbar: None

Exploring the Lorenz System

In this Notebook we explore the Lorenz system of differential equations:

$$\begin{aligned} \dot{x} &= \sigma(y - x) \\ \dot{y} &= \rho x - y - xz \\ \dot{z} &= -\beta z + xy \end{aligned}$$

This is one of the classic systems in non-linear differential equations. It exhibits a range of complex behaviors as the parameters  $(\sigma, \rho, \beta)$  are varied, including what are known as chaotic solutions. The system was originally developed as a simplified mathematical model for atmospheric convection in 1963.

In [ ]:

```
Interact(Lorenz, N=Fixed(10), angle=[0., 360.],
         p=[0.0, 50.0], rho=[0., 5], g=[0.0, 50.0])
```

The Jupyter Notebook

The Jupyter Notebook is an open-source web application that allows you to create and share documents that contain live code, equations, visualizations and narrative text. Uses include: data cleaning and transformation, numerical simulation, statistical modeling, data visualization, machine learning, and much more.

Try it in your browser

Install the Notebook

© Mirjana Stojilovic, EPFL, 2022

# Requirements and Installation

Requirements: Python 3.3 or greater

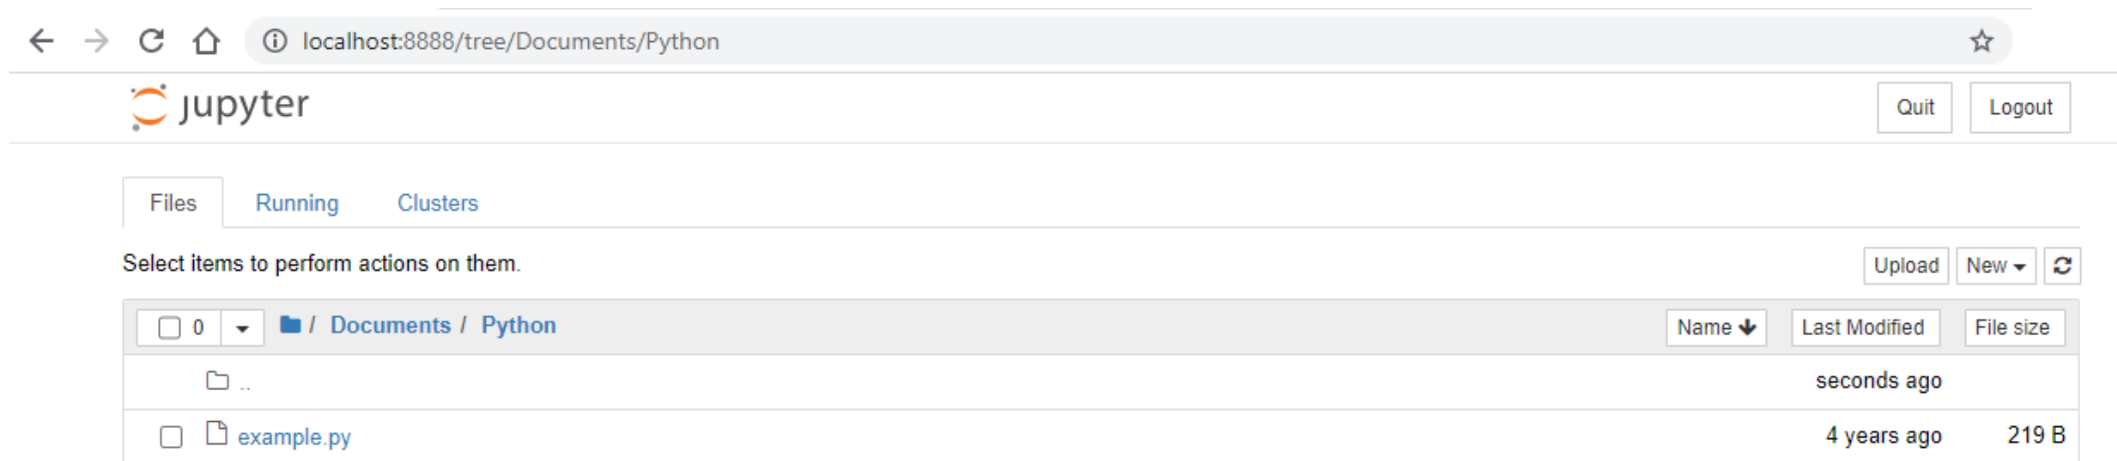

Installation:

- If you **do not** have Python installed, the easiest is to install **Anaconda** distribution (contains both Python and >700 packages)
  - Link: [Mac OS X](#)
  - Link: [Windows](#)
  - Link: [Linux](#)
- To install **only** the Jupyter Notebook, type in the terminal:

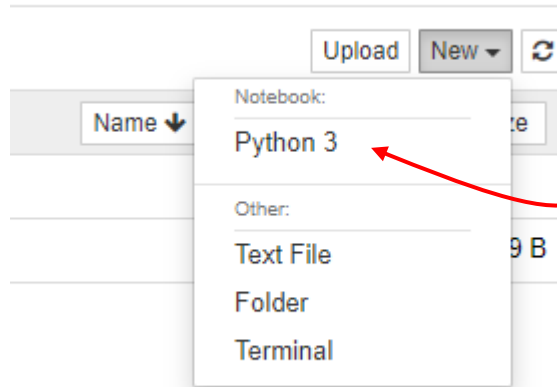

**pip install jupyter**

# Creating a Jupyter Notebook

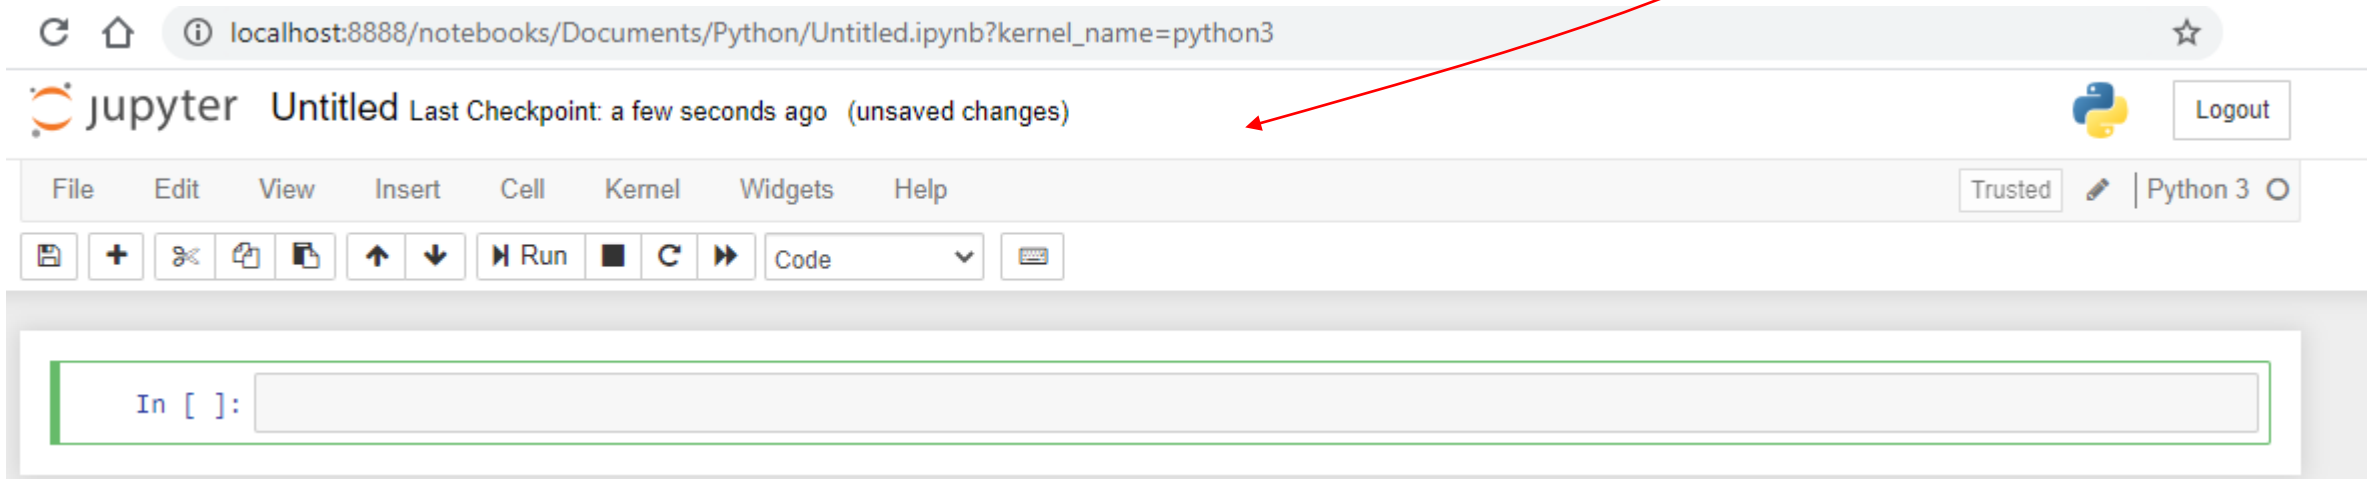

- Launch Jupyter Notebook by typing in the terminal  
`jupyter notebook`
- After launching, your local web browser should be redirected to a default address <http://localhost:8888> and a page that resembles the following should open:

# Creating a Jupyter Notebook

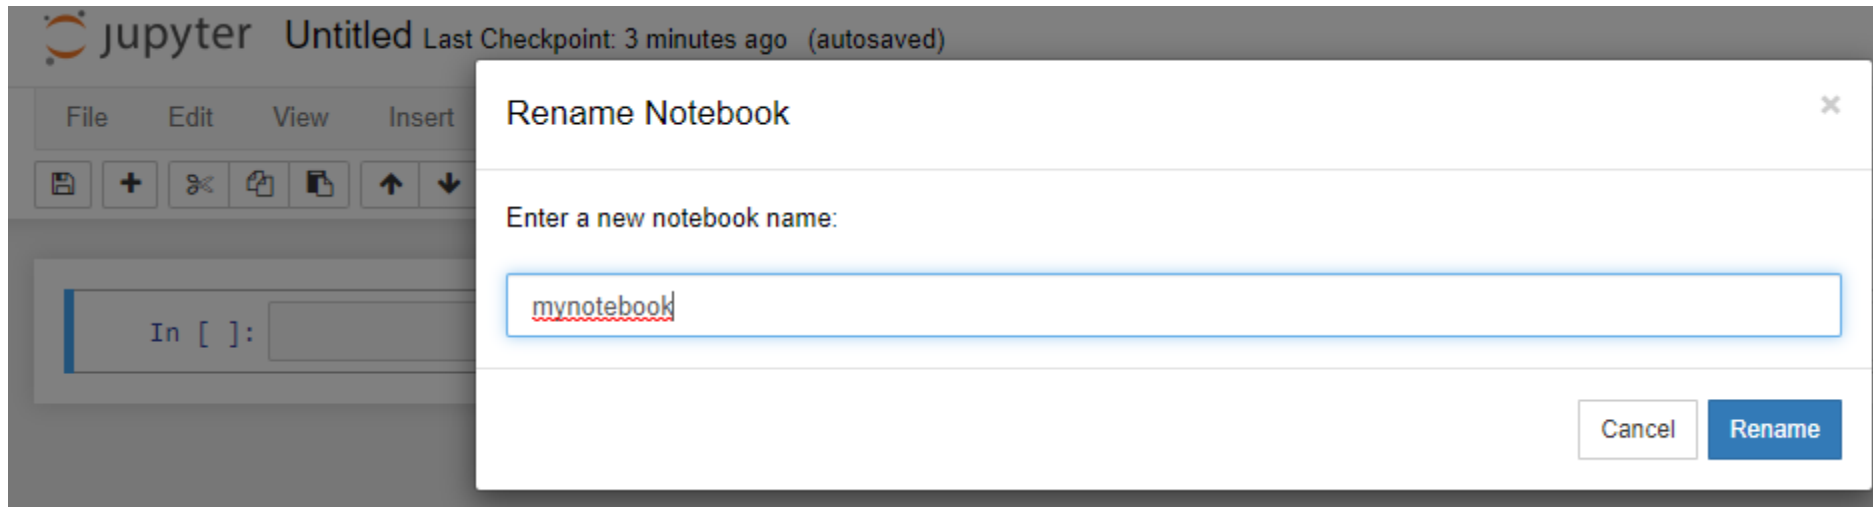

By selecting Python 3 from the **New** dropdown menu, you will create a new **blank** Jupyter Notebook file

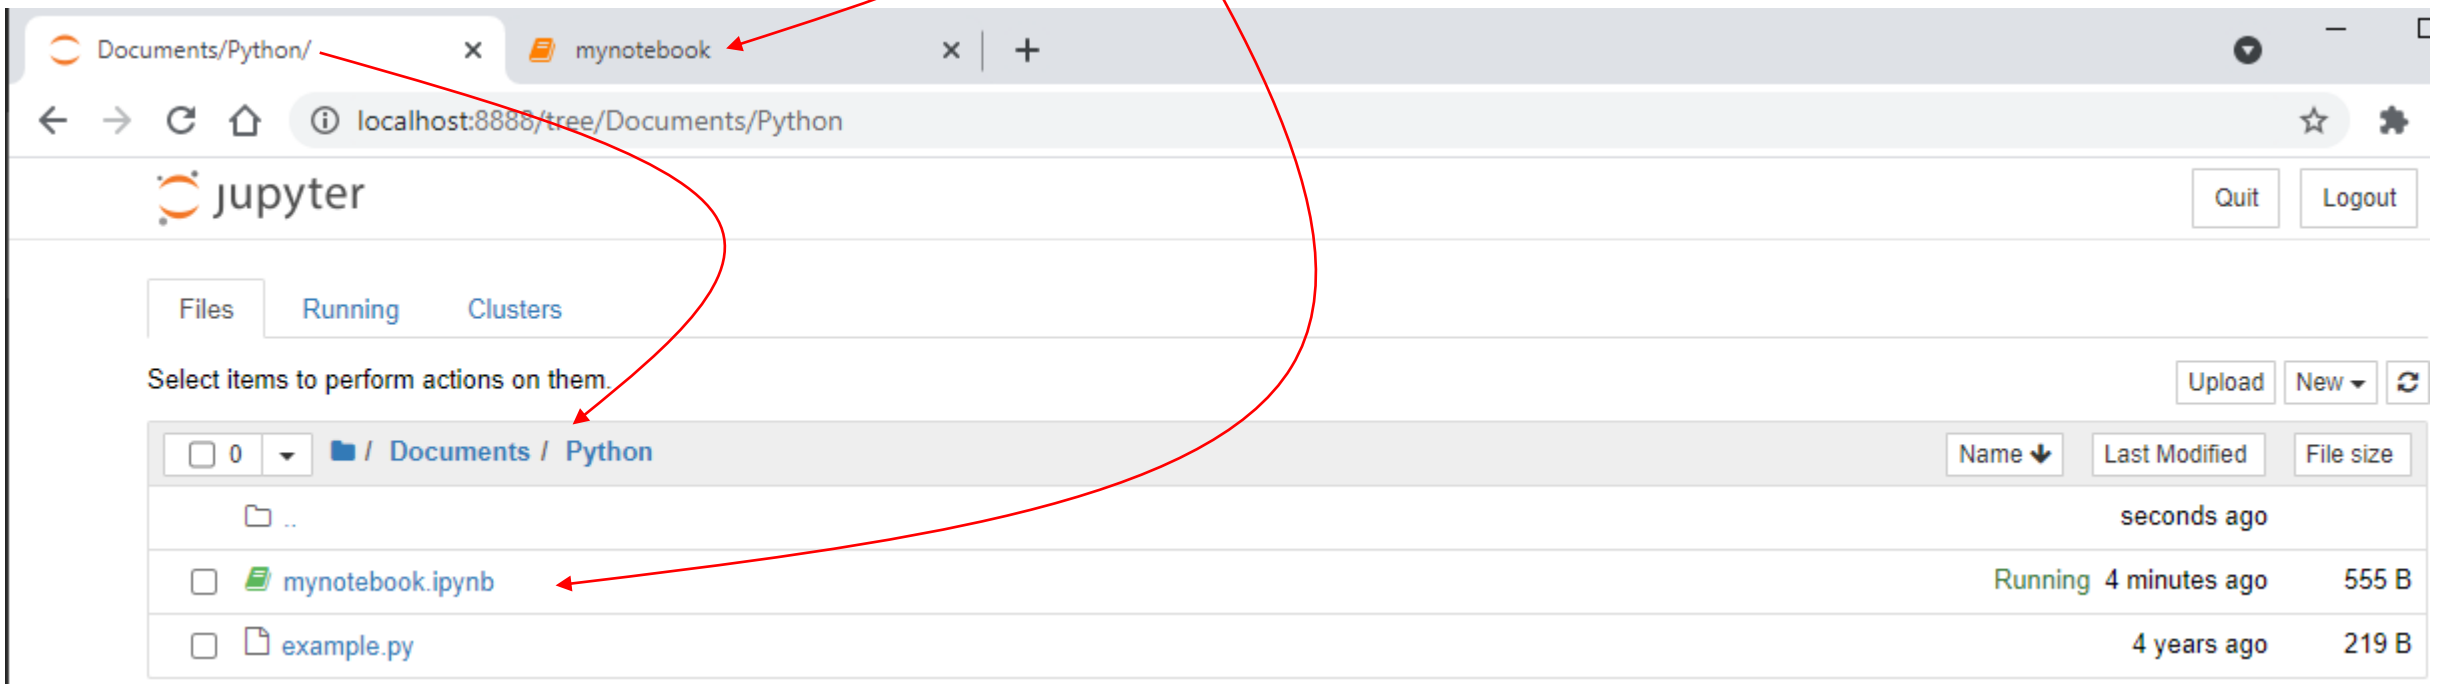

# Creating a Jupyter Notebook

- Let us rename the file from Untitled to **mynotebook**, for example

# Creating a Jupyter Notebook

- Once renamed, the new Notebook (a file with extension **ipynb**) appears in the corresponding directory

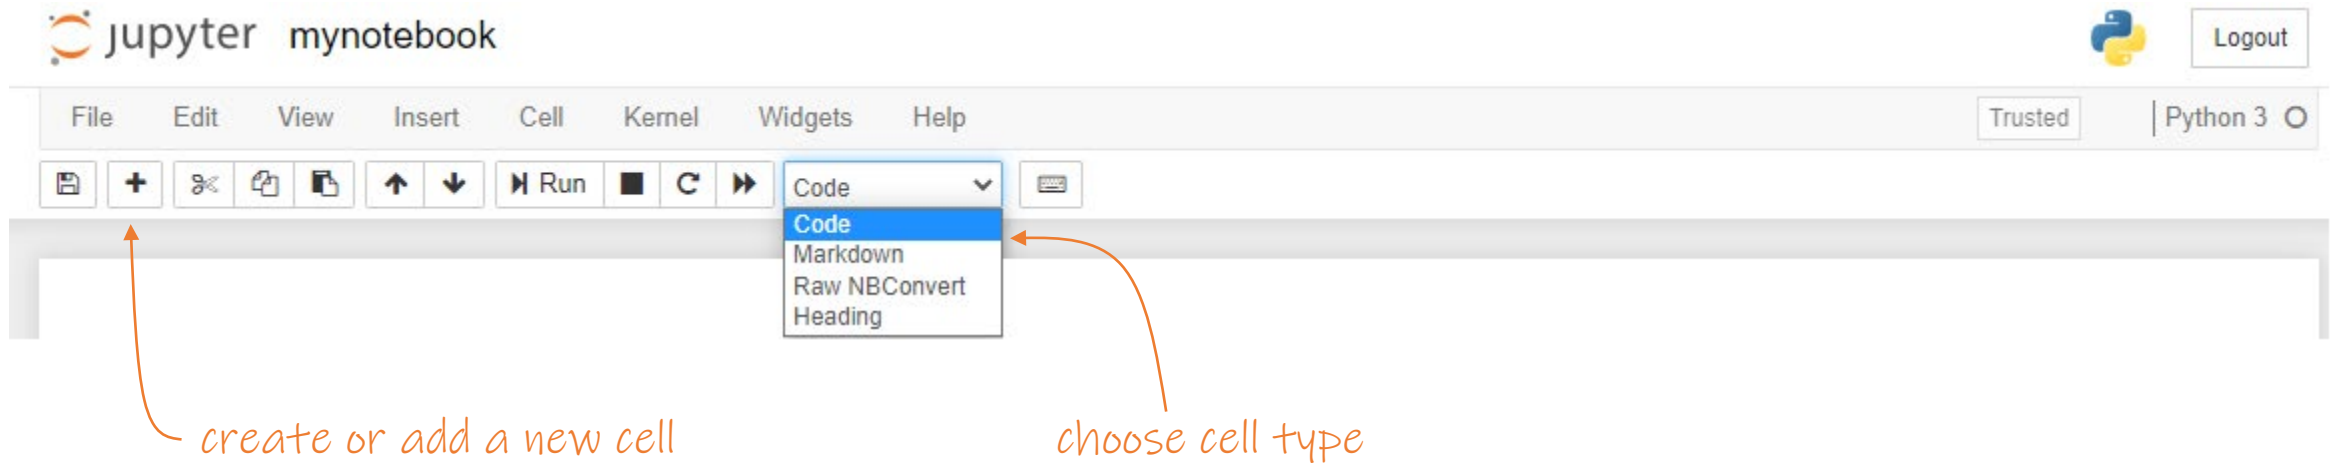

# Jupyter Notebook Cells

# Cells

- Notebook is composed of **cells**
- Two main types of cells
  - **code** cells
  - **text** cells (in a **Markdown** format)

# Running Code Cells

- Example, after adding two cells with some code:

jupyter mynotebook Last Checkpoint: 4 hours ago (autosaved) Python 3 Logout

File Edit View Insert Cell Kernel Widgets Help Trusted

Run Code

```
In [ ]: a = [0, 99, 3, 11, -5]
        a.reverse()
        print(a)
```

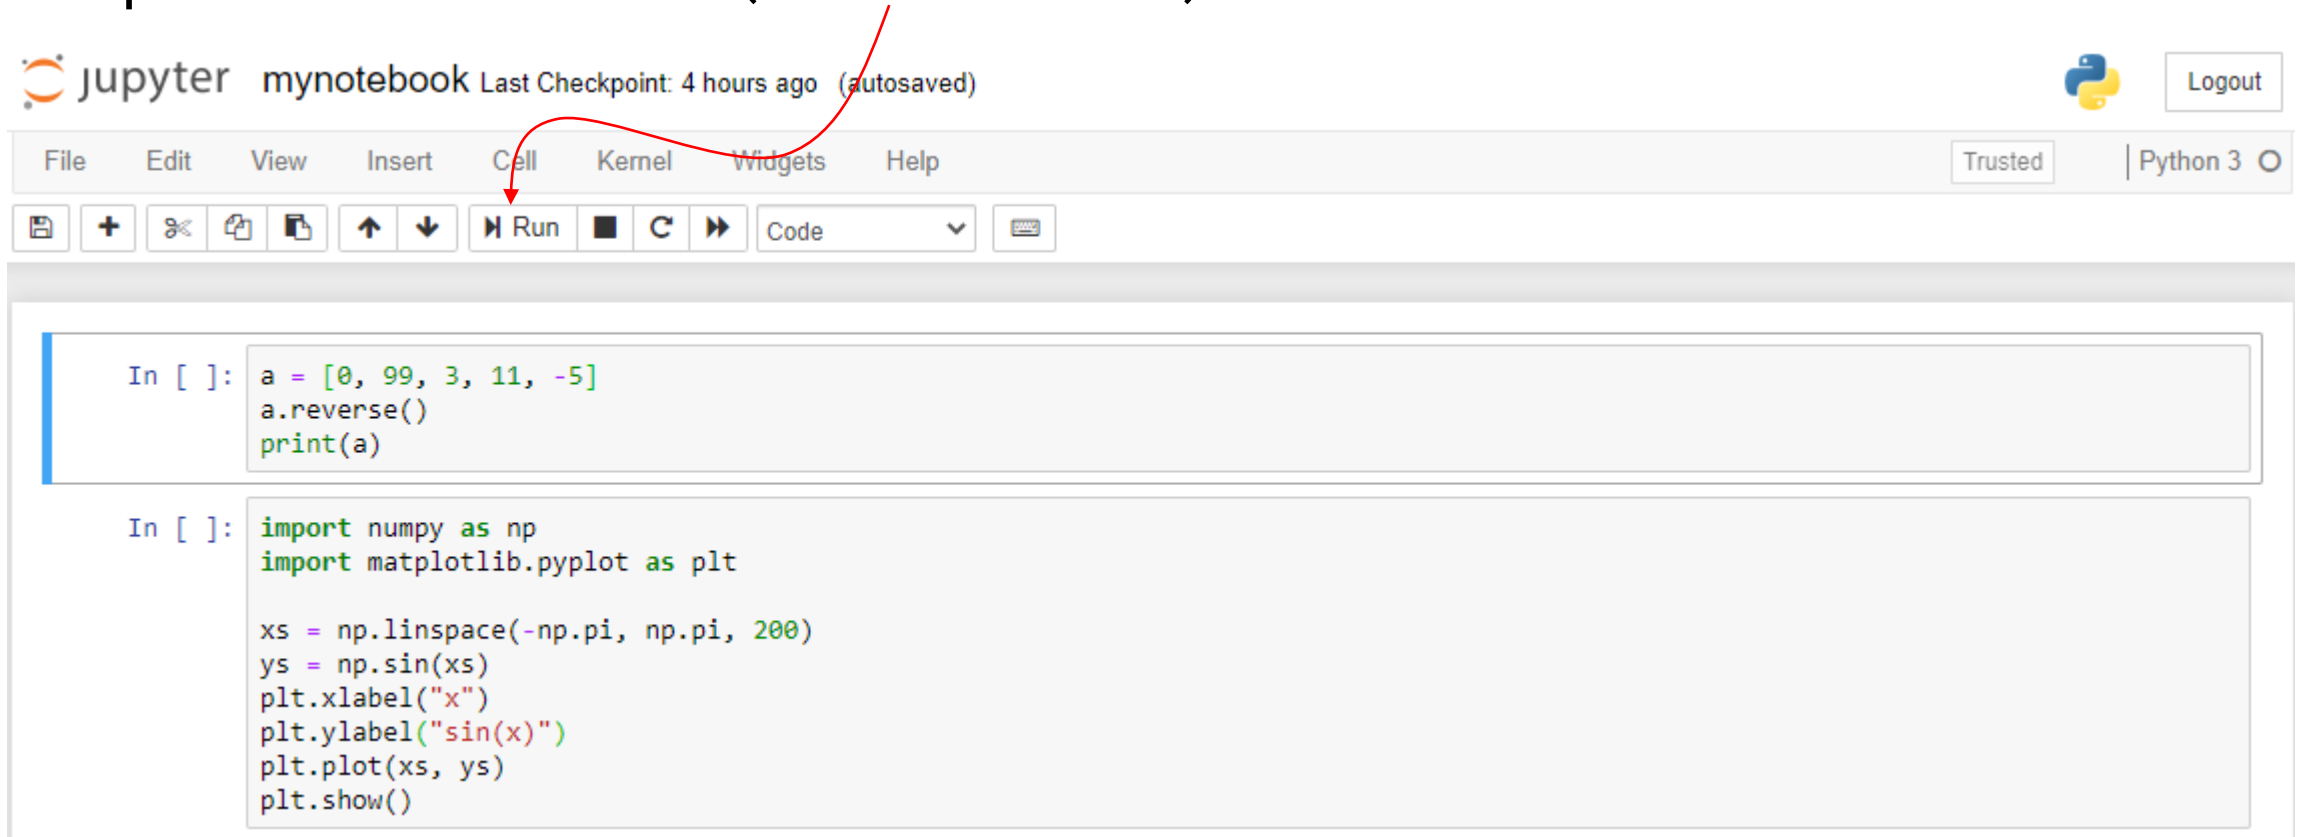

```
In [ ]: import numpy as np
        import matplotlib.pyplot as plt

        xs = np.linspace(-np.pi, np.pi, 200)
        ys = np.sin(xs)
        plt.xlabel("x")
        plt.ylabel("sin(x)")
        plt.plot(xs, ys)
        plt.show()
```

to edit cell contents, click on the cell

# Running Code Cells

- To run a single cell, we should **select** that cell (by **clicking** on it) and press **CTRL+ENTER** (or **Run** button)

# Running Code Cells

- To run a single cell, we should **select** that cell (by **clicking** on it) and press **CTRL+ENTER** (or **Run** button)

```
In [1]: a = [0, 99, 3, 11, -5]
a.reverse()
print(a)
```

[ -5, 11, 3, 99, 0 ]

*results*

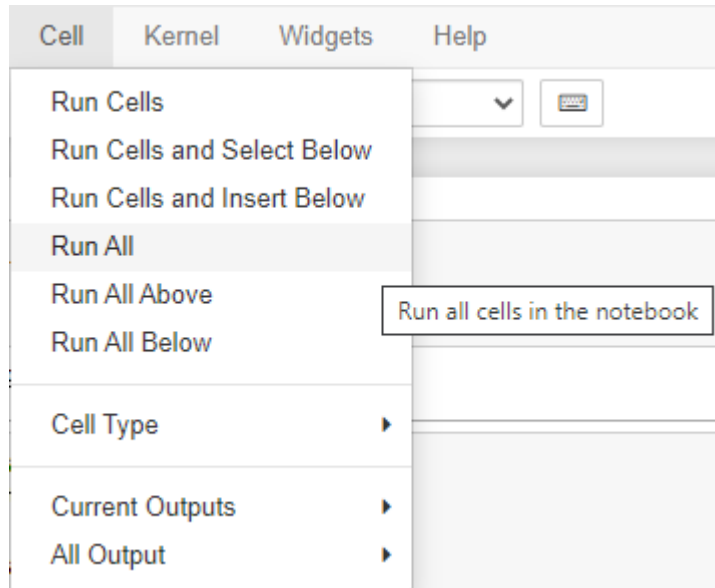

```
In [3]: import numpy as np
import matplotlib.pyplot as plt

xs = np.linspace(-np.pi, np.pi, 200)
ys = np.sin(xs)
plt.xlabel("x")
plt.ylabel("sin(x)")
plt.plot(xs, ys)
plt.show()
```

# Running Code Cells

- To run all cells, we choose **Run All** from **Cell** dropdown menu

# Kernel

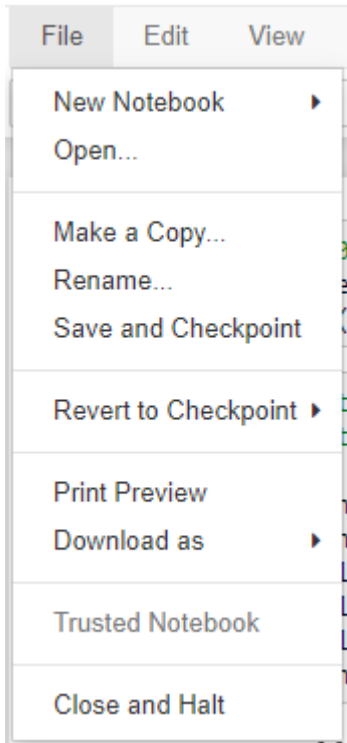

- A notebook kernel is a computational engine that executes the code in the notebook document
- When the notebook is executed (either cell by cell or Cell → Run All), the kernel performs the computation and produces the results
- Commonly used options:
  - **Interrupt**: stop the execution of a particular cell
  - **Restart**: restart the kernel
  - **Restart & Clear Output**: restart the kernel and reset all previously run cells
  - **Shutdown**: terminates the session of that notebook

# Dropdown menus

# File

- **File** dropdown menu allows to
  - **create** new notebooks
  - **open** an existing notebook
  - **make duplicates** of the notebook
  - **rename** the notebook
  - **save** the notebook (shortcut: **CTRL+S**)
  - **revert** to checkpoint (revert to the last saved state)
  - **print preview** (gets you a clean view of the code)
  - **download as** HTML, Python script, Markdown, PDF, etc.
  - **close and halt** ends the currently running session and shuts down the kernel

# Edit

- **Edit** dropdown menu allows to manipulate cells
  - cut
  - copy or paste or replace
  - delete or undo delete
  - split or merge cells
  - move cells (up or down)
  - find and replace
  - etc.

# Widgets

```
In [11]: from ipywidgets import interact

@interact(n=(0, 20))

def diamond(n):
    # LOOP to iterate over the different lines
    for i in range (0, n):
        for j in range (1, n - i):
            print(" ", end = "")
        for k in range (1, 2*(i + 1)):
            print("*", end = "")
        #NEXT LINE
        print("")
```

- [ipywidgets](#) package
  - Widgets are eventful objects, such as sliders, progress bars, text boxes, radio buttons
  - List of widgets: [link](#)
- slider widget  
allowing  
dynamic change  
of variable  $n$
- Widgets dropdown menu saves or clears widget state

# Closing Notebooks

- Closing the browser (or the tab) will **not** close the Jupyter Notebook
- Steps to properly close a running notebook
  1. save it first (**CTRL+S**)
  2. shut down its **running** kernel (**File → Close and Halt**)
  3. quit the **terminal** from which you started the notebook

The screenshot shows the Jupyter Notebook web interface in a browser. The address bar indicates the URL is `localhost:8888/tree/Documents/Python`. The interface has tabs for 'Files', 'Running', and 'Clusters'. The 'Running' tab is active, showing a list of running notebooks. The file list includes:

	Name	Last Modified	File size
<input type="checkbox"/>	..	seconds ago	
<input type="checkbox"/>	mynotebook.ipynb	Running 4 minutes ago	555 B
<input type="checkbox"/>	example.py	4 years ago	219 B

A green arrow originates from the text 'File → Close and Halt' in the list above and points to the 'Running' status of the 'mynotebook.ipynb' file in the table.

# Text Cells and Markdown

# Text cells

- We can combine text with code
- For text, choose the **text** cell type

- The text should be entered in Markdown format/syntax
  - Link: [Wiki](#)
  - Link: [cheatsheet](#)

# Markdown Syntax

<i>Element</i>	Markdown Syntax
<i>Heading</i>	# Heading-level 1 ## Heading-level2 ### Heading-level3
<i>Bold</i>	<b>**text in bold**</b>
<i>Italic</i>	<i>*italicized text*</i>
<i>Blockquote</i>	> Blockquote
<i>Ordered list</i>	1. First item 2. Second item 3. Third item
<i>Unordered list</i>	- First item - Second item - Third item
<i>Code</i>	`code`
<i>Horizontal rule</i>	---

# Jupyter Notebook and VS Code

# In VS Code

- Open the folder where your Notebook (file with extension `ipynb`) is located
  - **File → Open Folder**
- Open the document
  - click on it or
  - **File → Open File**

# In VS Code
